American badger *Taxidea taxus*	–/SSC/–	In California, badgers occur throughout the state except in humid coastal forests of northwestern California in Del Norte and Humboldt Counties	Badgers occur in a wide variety of open, arid habitats but are most commonly associated with grasslands, savannas, mountain meadows, and open areas of desert scrub; the principal habitat requirements for the species appear to be sufficient food (burrowing rodents), friable soils, and relatively open, uncultivated ground	Low. One historic record (1938) reported approximately 8 miles from the study area. Study area contains limited suitable habitat for this species.

Status explanations:

Federal

E = listed as endangered under the Federal Endangered Species Act.

T = listed as threatened under the Federal Endangered Species Act.

P = species for which USFWS has on file sufficient information on biological vulnerability and threat(s) to support issuance of a proposed rule to list, but issuance of the proposed rule is precluded.

– = no listing.

State

E = listed as endangered under the California Endangered Species Act.

T = listed as threatened under the California Endangered Species Act.

FP = fully protected under the California Fish and Game Code.

SSC = species of special concern in California.

C = candidate for listing

– = no listing.

Western Bat Working Group (WBWG) Available: http://www.wbwg.org/spp_matrix.html)

High priority = species are imperiled or at high risk of imperilment

Moderate priority= this designation indicates a level of concern that should warrant closer evaluation, more research, and conservation actions of both the species and possible threats. A lack of meaningful information is a major obstacle in adequately assessing these species' status and should be considered a threat

Low priority = While there may be localized concerns, the overall status of the species is believed to be secure.

1

Valley Elderberry Longhorn Beetle

Although no occurrences of VELB have been reported in the study area one CNDDB (2009b) record for VELB occurs within a mile of the study area along the Sacramento River riparian corridor. Numerous other occurrences are located within 10 miles of the study area. Although not reported to occur in the study area, elderberry shrubs sized 1 inch or more at ground level are present in the study area and therefore VELB has potential to occur. See elderberry shrub survey map Figure 4.12-1 for locations of these shrubs.

Giant Garter Snake

There are no CNDDB (2009b) records for giant garter snakes in the study area, although there are approximately 25 occurrences within 10 miles of the study area, most of which are labeled as sensitive. The closest of these occurrences is located in a drainage canal approximately 2 miles northeast of study area (California Natural Diversity Database 2009b).

Aquatic features in the study area include a drainage ditch, a depressional wetland, and open water (canal and pond north of canal pump station) areas. The drainage ditch is narrow, minimally vegetated, and was observed to contain little to no water during the snakes active period and therefore does not contain suitable habitat for this species. The depressional wetland and open water areas contain suitable aquatic habitat for this species and are associated with higher ground grassy uplands that would provide suitable basking and cover areas. Therefore, suitable aquatic and upland habitat for this species occurs in the study area adjacent to the construction site.

Western Pond Turtle

CNDDB (2009a, b) records do not indicate any western pond turtle occurrences in the study area. However pond turtles have been incidentally observed approximately 5 miles southeast of the study area in ponds west of South River Road, by ICF Jones & Stokes biologists. Additionally, western pond turtle is recorded to occur 8 miles east of the study area in a drainage at the McClellan Air Force Base (California Natural Diversity Database 2009a, b).

In the study area, the depressional wetland and open water areas contain suitable aquatic habitat for this species while surrounding upland areas may provide winter hibernacula and nesting habitat.

Swainson's Hawk

According to CNDDB (2010), five nest sites occur within 0.5 mile of the CHP Academy EIP project area. One nest site occurs within 100 feet, in the Sacramento Bypass. This nest site is located in a cottonwood tree in the depressional wetland north and adjacent to the study area. The nest was last observed to be used for breeding in 2001, at which time a breeding pair and three juveniles were observed. The next nearest nest site to the project area is located south of the Sacramento Bypass, west of the drainage canal in a cottonwood tree in a wetland corridor. This nest was last observed to be used for breeding in 2000, at which time two juveniles were observed. A third nest site is located in a cottonwood tree along the western end of the Sacramento Bypass Levee. This nest was last observed to be used for breeding in 2001, at which time a breeding pair and three juveniles were observed. Lastly, two nest sites are located in a riparian corridor on the east side of the Sacramento River. One of the nests was last observed to be used for breeding in 1998, at which time a breeding

pair were observed. The other nest was last observed to be used for breeding in 2000, at which time two juveniles were observed. In addition, there are numerous other Swainson's hawk nests reported within 10 miles of the study area (California Natural Diversity Database 2010). Grasslands in the study area are likely used as foraging habitat for this species.

WSAFCA has contacted the Yolo Natural Heritage Program to determine if additional nests have been noted through its survey efforts. Information was not readily available; however, should additional nests be determined to occur within 0.5 mile of the study area, they will be noted for preconstruction surveys.

White-Tailed Kite

There are no CNDDB (2009b) occurrences reported for this species in the study area. CNDDB (2009b) records indicate white-tailed kite nesting records within 10 miles of the study area with the closest occurrence approximately 4 miles east of the study area. Large trees within and adjacent to the study area provide suitable nesting habitat, and grasslands provide suitable foraging habitat.

Loggerhead Shrike

CNDDB (2009b) records do not indicate any loggerhead shrike occurrences within 10 miles of the study area. However, the study area is within the expected range for this species. Scattered trees and shrubs in the study area have potential to support nesting of this species and grasslands provide suitable foraging habitat.

Tricolored Blackbird

There are no CNDDB (2009b) occurrences for this species in the study area. Within 10 miles of the study area, CNDDB (2009b) indicated one tricolored blackbird nesting site located approximately 2 miles south of the study area, located near the Port of West Sacramento, in the vicinity of the Port North Levee. The birds were reported to be nesting in an area containing thistle and mustard in 1969 and 1974. The size of this population was not reported. The study area does not contain suitable nesting habitat for this species though grasslands provide suitable foraging habitat for this species.

Purple Martin

There are no CNDDB (2009b) occurrences for this species in the study area. Between 21 and 29 pairs of birds have been recorded nesting in weep holes under the I-5 freeway overpass at I Street approximately 3 miles southeast of the study area (California Natural Diversity Database 2009b). Numerous other CNDDB (2009b) nesting colonies under freeway or street overpasses have been reported within a 10-mile radius of the study area. In the study area, suitable nesting habitat for this species occurs within trees within the riparian forest.

Northern Harrier

There are no CNDDB (2009b) occurrences for this species in the study area. CNDDB (2009b) records do not indicate any northern harrier occurrences within 10 miles of the study area. Annual grasslands in the study area provide potential foraging habitat for this species.

Figure 4.12-1
CHP Academy Site: Elderberry Shrub Survey Map

Western Burrowing Owl

There are no CNDDB (2009b) occurrences for this species in the study area. CNDDB (2009b) indicated numerous burrowing owl records within10 miles of the study area. The closest recorded nesting record is within 1 mile of the site located 0.2 mile southwest of the intersection of Highway 84 and Harbor Boulevard, in the Sacramento River North Levee reach. Grassland areas in the study area provide suitable nesting habitat where ground squirrel burrows are present and open grassland areas near suitable nesting habitat provide suitable foraging habitat.

Hoary Bat

There are no CNDDB (2009b) occurrences for this species in the study area. CNDDB (2009b) records indicate a hoary bat observation approximately 3 miles southeast of the study area within the Sacramento River North Levee reach. Riparian forest in the study area provides suitable nesting and foraging habitat for this species.

Western Red Bat

There are no CNDDB (2009b) occurrences for this species in the study area or within 10 miles of the study area. Riparian forest in the study area provides suitable nesting and foraging habitat for this species.

Pallid Bat

There are no CNDDB (2009b) occurrences for this species in the study area or within 10 miles of the study area. Riparian forest in the study area provides suitable nesting and foraging habitat for this species.

4.12.2 Environmental Consequences

This section describes the environmental consequences relating to wildlife for the proposed CHP Academy EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of the CHP Academy EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects described in Section 3.10.3.3, Effects and Mitigation Measures.

4.12.2.1 Assessment Methods

The effect analysis below is quantitative and is based on site-specific information. The mitigation measures described for potential effects on sensitive biological resources have not been developed through consultation with resource agencies (e.g., DFG, USFWS, and USACE) at this time but are based on standard agency guidance.

The key effects were identified and evaluated based on the environmental characteristics of the CHP Academy EIP project area and the magnitude, intensity, and duration of activities related to the construction and operation of this project.

4.12.2.1.1 Effect Mechanisms

The following project-related activities could affect wildlife resources in the study area. These types of direct and indirect effects were used to assess effects on wildlife resources.

Direct Effects

Direct effects on wildlife could be caused by the following actions:

- vegetation clearing (including trees), grading, excavating/trenching, placement of rock slope protection, and paving activities during construction;
- temporary stockpiling and sidecasting of soil, construction materials, or other construction wastes;
- soil compaction, dust, and water runoff from the construction site;
- short-term construction-related noise (from equipment); and
- degradation of water quality in drainages and wetlands, resulting from construction runoff containing petroleum products.

Indirect Effects

Indirect effects on wildlife could e caused by the following actions:

- permanently altering light and noise levels;
- altering hydrology;
- causing damage through toxicity associated with herbicides, insecticides, and rodenticides;
- introducing pet and human disturbance (including trash dumping);
- increasing habitat for native competitors or predators; and
- introducing invasive non-native species.

4.12.2.2 Determination of Effects

For this analysis, an effect pertaining to wildlife resources was considered significant if it would result in any of the following environmental effects, which are based on professional practice and State CEQA Guidelines Appendix G (14 CCR 15000 *et seq.).*

- have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by DFG or the USFWS;
- interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance;
- conflict with the provisions of an adopted habitat conservation plan, natural communities conservation plan, or other approved local, regional, or state habitat conservation plan; or

- contribute to a substantial reduction or elimination of species diversity or abundance.

Qualitative relationships between environmental conditions and life stage survival or wildlife resources are the basis of the effect assessment. Cause and effect relationships are identified for assessment species, including the relationship between environmental conditions and habitat, and the effects of changes in habitat on survival.

The mitigation measures described for potential effects on sensitive biological resources have not been developed through formal consultation or coordination with resource agencies (e.g., DFG, USFWS, NMFS, and the USACE). As part of the environmental analysis for the project, WSAFCA will contact agencies as part of the environmental compliance process to determine specific compensatory mitigation for effects on wetlands, state- and federally listed species, and riparian habitats. Additional mitigation measures may also be identified as conditions of future action permits (e.g., a BO, Section 7 Incidental Take Statement, or Section 1602 Streambed Alteration Agreement).

4.12.3 Effects and Mitigation Measures

4.12.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento Bypass Levee reach in the CHP Academy EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects on wildlife, such as displacement or loss of habitat would occur.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento Bypass Levee could fail due to seepage or slope stability/geometry issues would continue. Failure of the Sacramento Bypass Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Wildlife program analysis (Section 3.10.3.3.1). In summary, these effects could include the physical displacement, mortality, or destruction of habitat for a significant number of special-status species. Little to no vegetation will be removed at this EIP site to comply with the USACE vegetation policy as there is very little woody vegetation within the specified corridor. No effects on wildlife are anticipated in relation to implementation of the USACE vegetation guidelines under the No Action Alternative.

4.12.3.2 CHP Academy Applicant Preferred Alternative

Implementation of the CHP Academy APA would result in the following effects on wildlife resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (VELB)	Less than significant		

Effect	Finding	With Mitigation	Mitigation Measure
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Western Pond Turtle)	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel VEG-MM-5: Install Construction Barrier Fencing to Protect Sensitive Biological Resources Adjacent to the Construction Zone WILD-MM-1: Document Special-Status Species and Their Habitats WILD-MM-2: Redesign the Action to Protect Special-Status Wildlife Habitat and Develop a Mitigation Monitoring Plan
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Giant Garter Snake)	Significant	Less than significant	WILD-MM-3: Coordinate with Resource Agencies and Develop Appropriate Wildlife Compensation Plans for Species Listed under ESA or CESA
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Swainson's Hawk)	Less than significant	N/A	N/A
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Migratory Birds)	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel WILD-MM-4: Avoid or Minimize Construction-Related Effects on Nesting Birds
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Burrowing Owl)	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel WILD-MM-2: Redesign the Action to Protect Special-Status Wildlife Habitat and Develop a Mitigation Monitoring Plan WILD-MM-3: Coordinate with Resource Agencies and Develop Appropriate Wildlife Compensation Plans for Species Listed under ESA or CESA
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Bats and Bat Roosts)	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel WILD-MM-5: Conduct a Preconstruction Survey for Roosting Bats and Avoid or Mitigate Potential Effects
WILD-3: Disturbance or Loss of Common Wildlife Species as a Result of Construction (Migratory Birds)	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel WILD-MM-4: Avoid or Minimize Construction-Related Effects on Nesting Birds
WILD-3: Disturbance or Loss of Common Wildlife Species as a Result of Construction (Other Species)	Less than significant	N/A	N/A
WILD-4: Disruption of Wildlife Movement Corridors as a Result of Construction	Less than significant	N/A	N/A

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (VELB)

Two elderberry shrubs occur in the study area. One elderberry shrub (EB 146) occurs in the northwestern area of the project site within the Sacramento Bypass. This shrub occurs adjacent to an existing maintenance road (approximately 30 feet wide) utilized for levee maintenance and patrolling activities. Grading activities are proposed to occur down the levee slope to the toe of the levee, approximately 30 feet from the shrub. Hauling activities may occur adjacent to the shrub, but outside the dripline. The other shrub (EB 177) is in the southeast corner of the project area approximately 15 feet from the proposed construction limits, beneath a large oak tree; neither are expected to be removed or disturbed. Elderberry shrub survey results are shown in Table 4.12-3, below, and the locations of these shrubs are shown in Figure 4.12-1.

Table 4.12-3. Elderberry Shrub Survey Results

Elderberry Shrub/Cluster Number	Number of Stems > 1 Inch and < 3 Inches	Number of Stems > 3 Inches and < 5 Inches	Number of Stems > 5 Inches	Total Number of Stems	Exit holes N/Y
Riparian					
EB177	0	0	1	1	N
Non-Riparian					
EB 146	20	3	1	24	Y
Total	**20**	**3**	**2**	**25**	**N/A**

Complete avoidance of effects on VELB is assumed when a 100-foot buffer (from construction) is established around elderberry shrubs. Direct effects on VELB may generally occur if construction occurs within 20 feet of elderberry shrubs. Indirect effects on VELB may generally occur if elderberry shrubs are located from 20 to 100 feet of construction.

WSAFCA has coordinated with the USFWS and agreed to protective measures for these shrubs. The following measures will be implemented to avoid and minimize effects on VELB:

- Before ground disturbance, all construction personnel will participate in a USFWS-approved worker environmental awareness program. A qualified biologist approved by the USFWS will inform all construction personnel about the life history of VELB and the importance of its host shrub, the elderberry. Proof of this instruction will be submitted to the USFWS.
- For shrub EB 146, 100 feet of concrete barriers (K-rails) will be installed along the maintenance road in front of the shrub (50 feet west and 50 feet east of the shrub). Beyond the concrete barrier, temporary orange construction fencing (4-foot-high commercial-quality woven polypropylene) will be installed to completely surround the shrub and form 20-foot construction buffer on the north, east and west sides of the shrub. For shrub EB 177, a 20-foot temporary orange construction fence buffer will be installed around the shrub and any adjacent vegetation that requires protection (see Figure 4-2). Within buffer areas, signs will be posted along fencing for the duration of construction. The signs will contain the following information:

This area is habitat of the valley elderberry longhorn beetle, a threatened species, and must not be disturbed. This species is protected by the Endangered Species Act of 1973, as amended. Violators are subject to prosecution, fines, and imprisonment.

- Buffer area fences around elderberry shrubs/clusters will be inspected weekly by a qualified biologist during ground-disturbing activities and monthly after ground-disturbing activities until project construction is complete or until the fences are removed, as approved by the biological monitor and the resident engineer. The biological monitor will be responsible for ensuring that the contractor maintains the buffer area fences around elderberry shrubs throughout construction. Biological inspection reports will be provided to the project lead and USFWS.
- WSAFCA will ensure that the project site will be watered down as necessary to prevent dust from becoming airborne and accumulating on elderberry shrubs in and adjacent to a project site.

Therefore, effects on VELB would be considered less than significant.

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Western Pond Turtle)

Although western pond turtle is not currently known to occur in the study area, there is potential for occurrence in the depressional wetland and surrounding riparian forest and in the open water areas. Although the project construction is limited to the toe of the Sacramento Bypass Levee, these features are located within 50 feet from the construction limit and therefore pond turtles using upland areas adjacent to aquatic features could be affected by project construction. Potential effects on this species include temporary disturbance to upland nesting or cover habitat and the potential for direct loss of individuals. Effects on western pond turtle would be considered significant. Implementation of Mitigation Measures VEG-MM-4, VEG-MM-5, WILD-MM-1, and WILD-MM-2 would reduce this effect to less than significant.

Mitigation Measure VEG--MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel

Mitigation Measure VEG-MM-5: Install Construction Barrier Fencing to Protect Sensitive Biological Resources Adjacent to the Construction Zones

Mitigation Measure WILD-MM-1: Document Special-Status Wildlife Species and Their Habitat

WSAFCA will retain a qualified wildlife biologist to document the presence or absence of suitable habitat for special-status wildlife. The following steps will be implemented to document special-status wildlife and their habitats:

- **Review existing information**. The wildlife biologist will review existing information to develop a list of special-status wildlife species that could occur in the action area. The following information will be reviewed as part of this process: the USFWS special-status species list for the action region, DFG's CNDDB, previously prepared environmental documents, city and county general plans, habitat conservation plans and natural community conservation plans (if there are any adopted by the time the action is constructed), and USFWS-issued BOs for previous actions.

- **Coordinate with state and Federal agencies**. The wildlife biologist will coordinate with the appropriate agencies (DFG and USFWS) to discuss wildlife resource issues in the action region and determine the appropriate levels of survey necessary to document special-status wildlife and their habitats.
- **Conduct field studies**. The wildlife biologist will evaluate existing habitat conditions and determine what levels of biological survey may be required. The type of survey required will depend on species richness, habitat type and quality, and the probability of special-status species occurring in a particular habitat type. Depending on the existing conditions in the action area and the proposed construction activity, one or a combination of the following levels of survey may be required:
    - **Habitat assessment.** A habitat assessment determines whether suitable habitat is present. This type of assessment can be conducted at any time of year and is used to assess and characterize habitat conditions and determine whether return surveys are necessary. If no suitable habitat is present, no additional surveys will be required.
    - **Conduct species-focused surveys.** Species-focused surveys (or target species surveys) will be conducted if suitable habitat is present for special-status wildlife and it is necessary to determine the presence or absence of the species in the action area. The surveys will focus on special-status wildlife species that have the potential to occur in the region. The surveys will be conducted during a period when the target species are present and/or active.
    - **Conduct protocol-level wildlife surveys.** The program proponent will comply with protocols and guidelines issued by responsible agencies for certain special-status species. USFWS and DFG have issued survey protocols and guidelines for several special-status wildlife species that could occur in the study area, including (but not limited to) VELB, Swainson's hawk, western burrowing owl, and giant garter snake. The protocols and guidelines may require that surveys be conducted during a particular time of year and/or time of day when the species is present and active. Many survey protocols require that only a USFWS- or DFG-approved biologist perform the surveys. The program proponent will coordinate with the appropriate state or Federal agency biologist before initiation of protocol-level surveys to ensure that the survey results will be valid. Because some species can be difficult to detect or observe, multiple field techniques may be used during a survey period, and additional surveys may be required in subsequent seasons or years as outlined in the protocol or guidelines for each species.

Mitigation Measure WILD-MM-2: Redesign the Action to Protect Special-Status Wildlife Habitat and Develop a Mitigation Monitoring Plan

Preconstruction surveys for western pond turtles in suitable aquatic habitat and associated upland areas will be conducted by a qualified biologist 2 weeks before and 24 hours prior to the start of construction activities. A survey will consist of three visits within a 2-week period, preferably during the appropriate time of year (March through October) and day (early morning) to maximize the chances of observing a turtle.

If a turtle is located within 100 feet of the construction limit, exclusion fencing will be installed to prevent turtles from entering the construction area. If a turtle is observed in the construction area during construction, it will be allowed to move out of this area on its own or, if necessary, be relocated out of this area (with authorization from the DFG), and exclusion fencing will be installed to prevent the movement of turtles back into the construction area. Additionally, the construction

area will be clearly defined, using orange barrier fencing, to minimize disturbance to riparian vegetation which could be utilized by western pond turtle as upland habitat.

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Giant Garter Snake)

Numerous occurrences of giant garter snake are reported in canals located within 10 miles of the study area with the closest occurrence located approximately 2 miles northwest of the study area. Giant garter snakes have potential to use aquatic habitat in the study area, including depressional wetland and open water areas. Upland areas adjacent to these aquatic habitats could also be used by giant garter snakes for basking, cover, and refuge areas. Construction is limited to the toe of the Sacramento Bypass Levee and would not affect adjacent aquatic habitat. However, because the toe of the levee is located within 200 feet of aquatic habitat there is some potential for garter snakes, if present, to seek refuge in burrows along the levee toe. Pursuant to on-site discussions with representatives of USFWS and DFG in December 2009, WSAFCA will implement the following measures to avoid and minimize effects on giant garter snake and their habitat:

- Before ground disturbance, all construction personnel will participate in a USFWS-approved worker environmental awareness program. A qualified biologist approved by the USFWS will inform all construction personnel about the life history of giant garter snakes and the importance of both aquatic and upland habitat areas. Proof of this instruction will be submitted to the USFWS.
- To reduce the likelihood of snakes entering these areas during construction activities, WSAFCA has agreed to install exclusion fencing along the depressional wetland and open water areas (areas within 200 feet of suitable habitat) (see Figure 4-2). The exclusion fencing will be installed during the active period for giant garter snakes (May 1 to October 1) to reduce the potential for direct loss of the species during this activity. The fencing will consist of 3- to 4-foot-tall erosion fencing buried at least 6 to 8 inches below ground level. The fencing will ensure that giant garter snakes are excluded from the construction area and that suitable upland and aquatic habitat is protected throughout construction. To ensure that construction equipment and personnel do not affect aquatic habitat for giant garter snake outside the construction corridor, a combination of K-rail fencing and orange barrier fencing will be erected (in addition to the exclusion fencing) to clearly define the aquatic habitat to be avoided.
- A USFWS-approved biologist will conduct a preconstruction survey in suitable habitat no more than 24 hours before construction. Prior to construction each morning, the biologist will survey for the presence of any giant garter snakes and inspect exclusion and orange barrier fencing to ensure they are both in good working order. The project area will be re-inspected whenever a lapse in construction activity of 2 weeks or more has occurred. If a snake is encountered during construction, activities will cease until appropriate corrective measures have been completed or it has been determined that the snake will not be harmed.
- Vegetation clearing within 200 feet of the banks of potential giant garter snake aquatic habitat will be limited to the minimum area necessary. Avoided giant garter snake habitat within or adjacent to the project area will be flagged and designated as an environmentally sensitive area, to be avoided by all construction personnel.
- The movement of heavy equipment within 200 feet of the banks of potential giant garter snake aquatic habitat will be confined to designated haul routes to minimize habitat disturbance.

Therefore, potential effects on this species include the temporary disturbance of less than 1 acre of upland habitat, which has potential to result in the loss of individuals. Effects on giant garter snake would be considered significant. Implementation of the agreed upon measures outlined above and Mitigation Measure WILD-MM-3 would reduce this effect to less than significant.

Mitigation Measure WILD-MM-3: Coordinate with Resource Agencies and Develop Appropriate Compensation Plans for Species Listed under ESA or CESA

Based on the USFWS's 1997 Programmatic Formal Consultation for Giant Garter Snake the project would likely result in only Level 1 impacts, which are defined as those that result in minimal environmental effects, such as repair, rehabilitation, or replacement of previously authorized structures, and would not result permanent habitat loss and would result in temporary habitat disturbance not exceed 20 acres (U.S. Fish and Wildlife Service 1997). Required mitigation would therefore likely consist of restoration of temporary impacts to giant garter snake habitat and one year of monitoring, as described below.

- **Restoration.** After completion of construction activities, remove any temporary fill and construction debris and, wherever feasible, restore disturbed areas to pre-project conditions. Restoration work may include such activities as replanting species removed from banks or replanting emergent vegetation in the active channel.
- **Monitoring.** Restoration of habitat should be monitored for 1year following implementation. Monitoring reports documenting the restoration effort should be submitted to USFWS (1) upon completion of the restoration implementation, and (2) 1 year from restoration implementation. Monitoring reports should include photo documentation, when restoration was completed, what materials were used, plantings (if specified) and justification of any substitutions to USFWS-recommended guidelines. Monitoring reports should also include recommendations for remedial actions and approval from USFWS, if necessary, and justification from release of any further monitoring, if requested.

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Swainson's Hawk)

The study area contains suitable Swainson's hawk nesting and foraging habitat. Swainson's hawk foraging habitat consists of grassland areas along the levee toe and within the Sacramento Bypass. A total of 14 acres of grasslands occur within the construction area, including the staging area. Because the availability of foraging habitat has been closely tied to the breeding success of this species, projects that will significantly modify suitable Swainson's hawk foraging habitat are considered to have potential to significantly affect this species (California Department of Fish and Game 1994). However, because construction would only result in temporary disturbance to suitable foraging habitat for this species this effect is less than significant and no mitigation is needed.

In addition, Swainson's hawks are known to nest in and adjacent to the study area, and project construction within this reach could affect Swainson's hawk, either directly or through habitat modification. As noted in the Environmental Setting section, CNDDB has documented five Swainson's hawk nests in the study area (California Natural Diversity Database 2010). Suitable nesting habitat for Swainson's hawk occurs within the riparian forest adjacent to the depressional wetland. Although riparian forest would not be removed for project construction, project construction noise has potential to result in nest disturbance where nests are present in adjacent riparian forest areas. Additionally, removal of landscape trees and shrubs, or other vegetation

clearing, grading, or other construction activities conducted during the nesting season (generally February 15 through August 31) could remove or cause abandonment of active nests of Swainson's hawk.

To avoid and minimize effects to Swainson's hawk, WSAFCA representatives coordinated with DFG representatives during a field visit in December 2009, and agreed to implement the following measures:

- Before ground disturbance, all construction personnel will participate in a CDFG-approved worker environmental awareness program. A qualified biologist will inform all construction personnel about the life history of Swainson's hawk and the importance of nest sites and foraging habitat.
- A breeding season survey for nesting birds will be conducted for all trees and shrubs that will be removed or disturbed which are located within 500 feet (0.5 mile for Swainson's hawk) of construction activities, including grading. Swainson's hawk surveys will be completed during at least two of the following survey periods: January 1 to March 20, March 20 to April 5, April 5 to April 20, and June 10 to July 30 with no fewer than three surveys completed in at least two survey periods, and with at least one of these surveys occurring immediately prior to project initiation (Swainson's Hawk Technical Advisory Committee 2000). Other migratory bird nest surveys can be conducted concurrent with Swainson's hawk surveys with at least one survey to be conducted no more than 48 hours from the initiation of project activities to confirm the absence of nesting. If the biologist determines that the area surveyed does not contain any active nests, construction activities, including removal or pruning of trees and shrubs, can commence without any further mitigation.
- If active nests are found, WSAFCA will maintain a 0.25-mile buffer between construction activities and the active nest(s). In addition, a qualified biologist will be present on-site during construction activities to ensure the buffer distance is adequate and the birds are not showing any signs of stress. If signs of stress that may cause nest abandonment are noted, construction activities will cease until a qualified biologist determines that fledglings have left an active nest.

The implementation of these agreed upon measure would ensure that effects on Swainson's hawk will be less than significant.

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Migratory Birds)

Several other special-status birds have potential to nest in or adjacent to the study area based on reported occurrences within a 10-mile radius. These species include white-tailed kite, northern harrier, loggerhead shrike, and purple martin.

These species are not reported to nest in the study area but are known to nest in the vicinity. Riparian forest and landscape tree areas adjacent to the construction area contain suitable nesting habitat for white-tailed kite and purple martin. Open grassland areas containing scattered shrubs and trees provide suitable nesting habitat for loggerhead shrike. Grasslands in the Sacramento Bypass area provide potential nesting habitat for northern harrier.

Tree and shrub removal, other vegetation clearing, grading, or other construction activities conducted during the nesting season (generally February 15 through August 31) could remove or cause abandonment of active nests of special-status birds, including species of special concern

(loggerhead shrike, northern harrier, and purple martin) and fully protected species (white-tailed kite), and other migratory birds protected under the MBTA and CFGC. Therefore, these effects would be considered significant. Implementation of Mitigation Measures Veg-4 and WILD-MM-4, described above, would reduce this effect to less than significant.

Mitigation Measure VEG--MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel

Mitigation Measure WILD-MM-4: Avoid or Minimize Construction-Related Effects on Nesting Birds

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Western Burrowing Owl)

Burrowing owl is reported to nest adjacent to the study area. In the study area, burrowing owls have potential to nest in grasslands and unvegetated areas along the Sacramento Bypass Levee where burrows or other nesting substrates are present. Construction activities, including grading and clearing activities within and adjacent to these lands cover types, could result in nesting failure, death of nestlings, or loss of eggs. Effects on a state species of special concern and species protected under the MBTA and CFGC are considered potentially significant. Implementation of Mitigation Measures VEG-MM-4, WILD-MM-2 and WILD-MM-3would ensure that project activities would not result in nesting disturbance or habitat loss for this species and reduce this effect to less than significant.

Mitigation Measure VEG--MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel

Mitigation Measure WILD-MM-2: Redesign the Action to Protect Special-Status Wildlife Habitat and Develop a Mitigation Monitoring Plan

In conformance with Federal and state regulations regarding the protection of raptors, a preconstruction survey for burrowing owls will be completed, in accordance with DFG guidelines described in the *Staff Report on Burrowing Owl Mitigation*, prior to the start of construction within suitable habitat and (where possible) in areas within 500 feet of the construction zone. Surveys should be conducted during the wintering (December 1 through January 31 recommended) and nesting (April 15 through July 15 recommended) seasons. Surveys should be conducted from 2 hours before sunset to 1 hour after, or from 1 hour before or 2 hours after sunrise. If no burrowing owls are located during these surveys, no additional action would be warranted. However, if breeding or resident owls are located on, or immediately adjacent to, the site, the following measures will be implemented.

- No burrowing owls will be evicted from burrows during the nesting season (February 1 through August 31). Eviction outside the nesting season may be permitted pending evaluation of eviction plans and receipt of formal written approval from the DFG authorizing the eviction.
- A 250-foot buffer, within which no new activity would be permissible, would be maintained between project activities and nesting burrowing owls. This protected area would remain in effect until August 31, or at the DFG's discretion and based on monitoring evidence, until the young owls are foraging independently.
- If accidental take (disturbance, injury, or death of owls) occurs, the DFG would be notified immediately.

Mitigation Measure WILD-MM-3: Coordinate with Resource Agencies and Develop Appropriate Wildlife Compensation Plans for Species Listed under ESA or CESA

If a preconstruction survey finds that burrowing owls occupy a project site, and occupied habitat will be converted to unsuitable habitat, habitat compensation on off-site mitigation lands will be implemented. Habitat management lands comprising existing burrowing owl foraging and breeding habitat will be acquired and preserved. An area of 6.5 acres (the amount of land found to be necessary to sustain a pair or an individual owl) will be secured for each pair of owls or for an individual, in the case of an odd number of birds.

Where construction would only temporarily modify occupied habitat but habitat value would return to the preproject condition, compensation would not be required.

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Bats and Bat Roosts)

Pallid bat, hoary bat, and western red bat are known to occur within the vicinity of the study and have potential to roost within riparian forests adjacent to the project site. Bat roosts of special-status species and non-special-status species are highly sensitive to disturbance and are considered a sensitive resource by DFG. Construction activities such as tree removal and trimming or construction noise could result in impacts on roosting bats, including the destruction of active roosts, the loss of individuals, or roost failure. In addition, nighttime construction activities could disturb bats emerging from nearby roosts resulting in the disruption of foraging activities. These effects could be considered significant if the subsequent population decline was large and affected the viability of the local populations of bats. Implementation of Mitigation Measures VEG-MM-4 and WILD-MM-5 would reduce this potential effect to less than significant.

Mitigation Measure VEG--MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel

Mitigation Measure WILD-MM-5: Conduct a Preconstruction Survey for Roosting Bats and Avoid or Mitigate Potential Effects

Prior to any tree trimming and removal or other construction activities, a qualified biologist should conduct a preconstruction survey to determine whether bats are present. The survey should consist of a nighttime emergence survey of suitable trees for evidence (presence of guano or urine stains) of use by bats, and it should be conducted no more than 14 days prior to construction activities. If the biologist determines that the area surveyed does not contain any active roosts, activities may commence without any further mitigation. If active roosts are found, roosting structures should be retained, and the need for a construction buffer should be determined through consultation with DFG. If avoidance is not possible, DFG may require that bats be excluded from the habitat prior to start of the breeding and/or hibernation season. Compensatory mitigation for the loss of roosting habitat also should be determined through consultation with DFG but may include the construction and installation of suitable replacement habitat on site.

Effect WILD-3: Disturbance or Loss of Common Wildlife Species as a Result of Construction (Migratory Birds)

Numerous non-special-status bird species also have potential to nest in or adjacent to the study area. Examples of these include red-tailed hawk, red-shouldered hawk, great horned owl, and American kestrel.

Tree and shrub removal, other vegetation clearing, grading, or other construction activities conducted during the nesting season (generally February 15 through August 31) could remove or cause abandonment of active nests of migratory birds protected under the MBTA and CFGC. Therefore, these effects would be considered significant. Implementation of Mitigation Measures Veg-4 and WILD-MM-4, described above, would reduce this effect to less than significant.

Mitigation Measure VEG--MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel

Mitigation Measure WILD-MM-4: Avoid or Minimize Construction-Related Effects on Nesting Birds

Effect WILD-3: Disturbance to or Loss of Common Wildlife Species as a Result of Construction (Other Species)

The study area contains both natural and constructed habitats that support numerous common species. These species include a wide variety of terrestrial and aquatic invertebrates, birds and raptors, amphibians, reptiles, and mammals. Although nesting migratory birds and bats would be protected from nesting disturbance through implementation of Mitigation Measure WILD-MM-1, WILD-MM-2, and WILD-MM-5, other species may be harmed or killed during construction. Other than nesting migratory birds and bats, other common wildlife species are not afforded protection under CEQA or NEPA because they are considered to be widespread and abundant. Effects on these species are therefore considered to be less than significant. No mitigation is required.

Effect WILD-4: Disruption of Wildlife Movement Corridors as a Result of Construction

In the study area, the Sacramento Bypass Levee may act as a movement corridor for wildlife. During construction of levee improvements, movement through the project site would be temporarily impeded by the placement of physical barriers (fencing) used to protect resources outside of the construction footprint but movement would be restored to the pre-project condition following construction. Therefore, disruption of movement through the project site is less than significant, and no mitigation is needed.

4.12.3.3 CHP Academy Alternative B

With respect to wildlife resources, the construction corridor and construction-related effects associated with CHP Academy Alternative B are the same as those described above for the CHP Academy APA. In the interest of brevity, effects discussions and mitigation measures are not repeated here.

Section 4.13
Land Use and Agriculture—CHP Academy Early Implementation Project

4.13.1 Affected Environment

This section describes the affected environment for land use and agriculture in the CHP Academy EIP project area, including the regulatory and environmental setting.

4.13.1.1 Regulatory Environment

4.13.1.1.1 Federal

The following Federal policies related to land use and agriculture may apply to implementation of the CHP Academy EIP. Please see Section 3.11.2.1, Regulatory Setting, for a more complete description of each policy.

- Farmland Protection Policy Act
- Federal Farmland Designations

4.13.1.1.2 State

The following state policies related to land use and agriculture may apply to implementation of the CHP Academy EIP. Please see Section 3.1.2.1, Regulatory Setting, for a more complete description of each policy.

- Williamson Act

4.13.1.1.3 Local

The following local policies related to land use and agriculture may apply to implementation of the CHP Academy EIP. Please see Section 3.11.2.1, Regulatory Setting, for a more complete description of each policy.

- Delta Protection Commission
- *Yolo County General Plan*
- *City of West Sacramento General Plan*

4.13.1.2 Environmental Setting

This section discusses the environmental setting related to land use and agriculture in the CHP Academy EIP project area.

The CHP Academy lies directly south of the Sacramento Bypass Levee, and directly east of the Sacramento River North Levee. The academy has a gymnasium, auditorium, quarter-mile track, obstacle course, jogging trails, dormitories, classrooms, a large water safety tank, an indoor and

outdoor shooting range, and a driving track. The academy trains cadets and provides specialized departmental training courses for other law enforcement agencies (California Highway Patrol 2008). The City of West Sacramento has zoned this area as public-quasi public (City of West Sacramento 2009). The CHP Academy is the only employer that has facilities that lie within, or adjacent to, the project site.

The Sacramento Bypass Wildlife Area lies north of the project site, in Yolo County and outside the city limits of West Sacramento. The area is owned by DFG. The area is 360 acres and is an important cover and feeding area for wildlife during late fall, winter, and early spring. The Sacramento Bypass receives overflow from the Sacramento River during periods of high precipitation. Hunting is allowed between September 1 and January 31. Fishing, hunting, and bird watching are also allowed (California Department of Fish and Game 2008).

The section of land located in the northeast corner of the project area is designated for agricultural use; however, it is not currently being used for that purpose. Additionally, it is not considered to be prime farmland, unique farmland, or farmland of statewide importance. The parcel of land is not part of a Williamson Act contract.

4.13.2 Environmental Consequences

This section describes the environmental consequences relating to land use and agriculture for the CHP Academy EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of the CHP Academy EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.11.3.3, Effects and Mitigation Measures.

4.13.2.1 Assessment Methods

This evaluation of land use and agriculture is based on a review of the regulatory setting above, review of the project in regard to compliance with Federal, state and local land use plans and regulations, and field observations. Key effects were identified and evaluated based on the environmental characteristics of the CHP Academy EIP project area and the magnitude, intensity, and duration of activities related to the construction and operation of this project.

4.13.2.2 Determination of Effects

For this analysis, an effect pertaining to land use and agriculture was analyzed under NEPA and CEQA if it would result in any of the following environmental effects, which are based on NEPA standards, State CEQA Guidelines Appendix G (14 CCR 15000 *et seq.*), and standards of professional practice.

For land use, an effect would:

- physically divide an established community;
- conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect; or
- conflict with any applicable habitat conservation plan or natural community conservation plan.

For agriculture, an effect would:

- convert prime farmland, unique farmland, or farmland of statewide importance;
- conflict with existing zoning for agricultural use, or a Williamson Act contract; or
- involve other changes in the existing environment, which because of their location or nature, could result in conversion of farmland to non-agricultural use.

4.13.3 Effects and Mitigation Measures

4.13.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento Bypass Levee reach in the CHP Academy EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects relating to land use and agriculture such as conversion of farmland or changes in land zoning would occur.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento Bypass Levee could fail due to seepage or slope stability or geometry issues would continue. Failure of the Sacramento Bypass Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Land Use program analysis (Section 3.11.3.3.1). In summary, these effects could include temporary and permanent reduction in agricultural productivity, conversion of land from its designated use, and physical division of established communities. In addition, if the Sacramento Bypass Levee were to fail, the CHP Academy itself would be in the direct line of floodwaters.

If the CHP Academy were inoperable for any length of time due to flood inundation, safety services could be compromised in the city and surrounding areas for an undefined period of time.

4.13.3.2 CHP Academy Applicant Preferred Alternative

Implementation of the CHP Academy APA would result in the following effect on land use and agriculture. A description of this effect is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect LU-1: Temporary Changes in Land Uses to Accommodate Construction	Less than significant	N/A	

Effect LU-1: Temporary Changes in Land Uses to Accommodate Construction

During construction of the CHP Academy APA, a staging area to house construction equipment and materials would be necessary (see Figure 4-1 for the location of the staging area). Temporary earthen ramps would also be constructed to allow equipment in the bypass to facilitate access between the levee crown and staging area. The area to be used for construction staging and stockpiling is located in the Sacramento Bypass and is currently subject to open space use, and the construction and access areas are located on lands zoned Public/Quasi-Public by the City of West Sacramento (see Figure 3.11-1). These lands are not heavily used and will be returned to their

original uses following the completion of construction. Thus, the CHP Academy APA would not result in significant effects on land use as a result of temporary land use changes. This effect is considered less than significant. No mitigation is required.

4.13.3.3 CHP Academy Alternative B

Implementation of the CHP Academy Alternative B would result in the following effect on land use and agriculture. A description of this effect is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect LU-1: Temporary Changes in Land Uses to Accommodate Construction	Less than significant	N/A	

Effect LU-1: Temporary Changes in Land Uses to Accommodate Construction

This effect is the same as described above under the CHP Academy APA. This effect is considered less than significant. No mitigation is required.

Section 4.14

Socioeconomic and Community Effects—CHP Academy Early Implementation Project

4.14.1 Affected Environment

This section describes the affected environment for socioeconomic and community effects in the CHP Academy EIP project area, including regulatory and environmental setting.

4.14.1.1 Regulatory Environment

The following policies related to socioeconomics and the community may apply to the implementation of the CHP Academy EIP. Please see the program information in Section 3.12.2.1, Regulatory Setting, for a more complete description of each policy.

4.14.1.1.1 Federal

- Uniform Relocation Assistance and Real Property Acquisition Policies Act

4.14.1.1.2 State

- Relocation Assistance and Property Acquisition

4.14.1.1.3 Local

- *City of West Sacramento General Plan*

4.14.1.2 Environmental Setting

This section discusses the environmental setting related to socioeconomic and community effects in the CHP Academy EIP project area.

A regional socioeconomic and community setting for the CHP Academy EIP project area is described in Section 3.12.2.2, Affected Environment. Additional details relevant to the analysis of socioeconomic and community effects at the CHP Academy EIP project area are listed below.

- No residences are located within or adjacent to the CHP Academy EIP project area and no relocation of residents would be required.
- No land in agricultural production is located within or adjacent to the CHP Academy EIP project area and no disruptions to agricultural production (either temporary or permanent) would occur as a result of construction or maintenance.
- As described in Section 3.15, Recreation, a minimal amount of recreational activity presently occurs in the Sacramento Bypass Levee reach, so implementation of an EIP project at the CHP Academy site would not affect recreation-related business.

4.14.2 Environmental Consequences

This section describes the environmental consequences relating to socioeconomics and the community for the CHP Academy EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of the CHP Academy EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.12.3.3, Effects and Mitigation Measures.

4.14.2.1 Assessment Methods

Effects on socioeconomics and the community were evaluated qualitatively based on the criteria listed below in Determination of Effects. Additionally, the CHP Academy EIP was evaluated for consistency with relevant local plans and policies at the Federal, state and local level.

4.14.2.2 Determinations of Effects

For this analysis, an effect pertaining to socioeconomics or the community was analyzed under NEPA and CEQA if it would result in any of the following environmental effects, which are based on NEPA standards, State CEQA Guidelines Appendix G (14 CCR 15000 et seq.), and standards of professional practice:

- a substantial change in employment;
- inducement of substantial population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure); or
- displacement of substantial numbers of existing housing or people, necessitating the construction of replacement housing elsewhere.

4.14.3 Effects and Mitigation Measures

4.14.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento Bypass Levee reach in the CHP Academy EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects relating to socioeconomics or the community would occur and there would be no changes in existing population or employment, except for the changes currently planned for in the appropriate local and state planning documents. No displacement of existing residences to accommodate an expanded levee footprint for certain levee alternatives would occur. Therefore, there would be no effect on this resource under the No Action Alternative.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento Bypass Levee could fail due to seepage or slope stability/geometry issues would continue. Failure of the Sacramento Bypass Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Socioeconomic and Community Effects program analysis (Section 3.12.4.1). To summarize the program analysis, should

a levee failure and associated flooding occur at this site, there could be widespread temporary or permanent displacement of residents. Damages suffered from flooding could lead to the long-term disruption of industrial, agricultural and retail economic activities within the city of West Sacramento and within the greater Sacramento region. Dependent on the degree of damage caused, disruption of activities could lead to a reduction in employment and short- to long-term depressed economic conditions citywide resulting from damage to industrial, retail and agricultural facilities and major transportation facilities that support their activities. These effects on socioeconomic conditions would be significant. Post-flooding conditions could result in short-term increases in employment for post-flooding cleanup and restoration activities, but these increases would not likely offset the potential losses.

4.14.3.2 CHP Academy Applicant Preferred Alternative

Implementation of the CHP Academy APA would result in the following effect on socioeconomics. A description of this effect is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect SOC-4: Temporary Increase in Employment in the Region during Construction	Beneficial	N/A	N/A

Effect SOC-4: Temporary Increase in Employment in the Region during Construction

Construction activities associated with implementation of the CHP Academy EIP would temporarily increase employment and personal income in the local area. Preliminary cost estimates anticipate that total construction-related expenditures associated with the CHP Academy APA would be approximately$5,000,000 to $10,000,000 (Vecchio pers. comm.), occurring in 2011. This is an estimate of direct costs only, and does not include indirect/induced changes in employment and personal income resulting from project construction. Project construction would benefit the local economy by temporarily increasing employment and personal income, although the increase in employment is not considered substantial when compared to total employment within the region. This effect on employment, however, would be beneficial.

4.14.3.3 CHP Academy Alternative B

Implementation of the CHP Academy Alternative B would result in the following effect on socioeconomics. A description of this effect is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect SOC-4: Temporary Increase in Employment in the Region during Construction	Beneficial	N/A	N/A

Effect SOC-4: Temporary Increase in Employment in the Region during Construction

Construction-related expenditures and employment estimates associated with CHP Alternative B have not been calculated, but are anticipated to be similar to the numbers presented for the CHP Academy APA. Project construction would benefit the local economy by temporarily increasing employment and personal income, although the increase in employment is not considered substantial when compared to total employment within the region. This effect on employment, however, would be beneficial.

Section 4.15
Environmental Justice—CHP Academy Early Implementation Project

4.15.1 Affected Environment

This section describes the affected environment for environmental justice in the CHP Academy EIP project area, including regulatory and environmental setting.

4.15.1.1 Regulatory Environment

4.15.1.1.1 Federal

The following Federal policy related to environmental justice may apply to the implementation of the CHP Academy EIP. Please see the program information in Section 3.13.2.1, Regulatory Setting, for a more complete description of each policy.

- Federal Executive Order 12898, Environmental Justice

4.15.1.1.2 State

The following state policies related to environmental justice may apply to the implementation of the CHP Academy EIP. Please see the program information in Section 3.13.2.1, Regulatory Setting, for a more complete description of each policy.

- State of California environmental justice regulations passed in 2001. These laws define environmental justice as "the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies."

4.15.1.2 Environmental Setting

This section discusses the environmental setting related to environmental justice in the CHP Academy EIP project area.

4.15.1.2.1 Study Area Demographics

The study area is in the city of West Sacramento, in Yolo County. For comparison, the same demographic information presented for West Sacramento is also presented for Yolo County and the State of California.

4.15.1.2.2 Local Setting

In 2000, Caucasians and Asians made up the largest two populations in the state, accounting for 59.5% and 10.9% of the population, respectively, while 16.8% of respondents claimed "other race." Those of Hispanic origin made up 32.4%, almost one-third of the State's population (U.S. Census 2008).

In 2000, Caucasians and Asians made up the largest two populations in Yolo County, accounting for 67.7and 9.9% respectively, while 13.8% of respondents claimed "other race." Those of Hispanic origin made up 25.9% of Yolo County (U.S. Census 2008).

In 2000, Caucasians and Asians made up the largest two populations in the city of West Sacramento accounting for 65% and 7.2% of the population respectively, while 16% claimed "other race." Those of Hispanic origin made up 30% of the city (U.S. Census 2008). Table 4.15-1 compares data regarding race in the study area in 2000 and 2005. Table 4.15-2 compares the household poverty status by city, county, and state.

Table 4.15-1. Race/Origin Characteristics by City/County/State, 2000 and 2005

	2000			2005		
	City of West Sacramento (percentage)	Yolo County (percentage)	State of California (percentage)	City of West Sacramento (percentage)	Yolo County (percentage)	State of California (percentage)
Race						
White	65.0	67.7	59.5	65.0	67	59.5
Black or African American	2.6	2	6.7	2.6	2	6.7
American Indian and Alaska Native	1.8	1.2	1.0	1.8	1	1.0
Asian	7.2	9.9	10.9	7.2	11	10.9
Native Hawaiian, other Pacific Islander	0.6	0.3	0.3	0.6	0.08	0.3
Some Other Race	16.0	13.8	16.8	16.0	12	16.8
Two or more races	6.9	5.2	4.7	6.9	5	4.7
Origin						
Hispanic	30.0	25.9	32.4	30.0	27.8	32.4

Table 4.15-2. Household Poverty Status by City/County/State, 2000

City	City of West Sacramento	Yolo County	State of California
Percent below poverty level	22.3	18.4	14.2

Source: U.S. Census Bureau 2000; California Employment Development Department 2000.

4.15.2 Environmental Consequences

This section describes the environmental consequences relating to environmental justice for the proposed CHP Academy EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of the CHP Academy EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.13.3.3, Effects and Mitigation Measures.

4.15.2.1 Assessment Methods

The population data that are pertinent to the analysis of environmental justice include race, income, and age characteristics such as:

- the percent of minority population (Black or African American, American Indian and Alaskan Native, Asian, Native Hawaiian and Other Pacific Islander, some other race, and two or more races);
- the percent of persons of Hispanic origin;
- the percent of population below the poverty level; and
- the percent of population residing below the U.S. Census Bureau poverty threshold, defined as a single person with an income below $8,840, or a family of four with an income below $16,588.

Proposed project environmental justice effects were analyzed by comparing census data from the local setting and regional setting with data for the State of California.

4.15.2.2 Determination of Effects

Effects pertaining to environmental justice were considered significant if the program would result in a disproportionate effect on minority or low-income communities.

4.15.3 Effects and Mitigation Measures

4.15.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento Bypass Levee reach in the CHP Academy EIP project area. No levee improvements would be made to increase the level of protection.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento Bypass Levee could fail due to seepage or slope stability/geometry issues would continue. Failure of the Sacramento Bypass Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Environmental Justice program analysis (Section 3.13.3.3.1). In summary, a catastrophic flood event would likely affect populations of all income and ethnic classifications and would not result in a disproportionately high or significant effect on minority or low-income populations.

4.15.3.2 CHP Academy Applicant Preferred Alternative

Implementation of the CHP Academy APA would result in the following effect on environmental justice. A description of this effect is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect EJ-1: Disproportionate Effect on Minority or Low-Income Populations	No effect	N/A	

Effect EJ-1: Disproportionate Effect on Minority or Low-Income Populations

The CHP Academy APA would reduce the risk of flooding to existing residential, commercial, and industrial development in the WSAFCA service area. While there are low-income and minority populations present throughout the study area, the flood protection benefits of the project would reach all segments of the population in the city of West Sacramento.

Section 4.9 anticipates that sensitive receptors could be exposed to significant levels of temporary construction-related noise along CHP Academy APA haul routes. However, there are few residences located along Reed Avenue and Harbor Boulevard, and the residences that do exist along these routes are not disproportionately low-income or minority (US Environmental Protection Agency 2009). Furthermore, these noise effects would be temporary. The City of West Sacramento has identified these roads as designated haul routes in the General Plan, and no other routes may be used.

The CHP Academy APA construction area itself is not located in or near a residential area. No residents would be displaced due to construction or operation of the CHP Academy APA, nor would the project physically divide an established community. The CHP Academy APA would therefore not result in a significant disproportionate effect on minority or low-income populations.

4.15.3.3 CHP Academy Alternative B

Implementation of the CHP Academy Alternative B would result in the following effect on environmental justice. A description of this effect is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect EJ-1: Disproportionate Effect on Minority or Low-Income Populations	No effect	N/A	

Effect EJ-1: Disproportionate Effect on Minority or Low-Income Populations

This effect is the same as described above under the CHP Academy APA. The CHP Academy Alternative B would not result in a significant disproportionate effect on minority or low-income populations.

Section 4.16
Visual Resources—
CHP Academy Early Implementation Project

4.16.1 Affected Environment

This section describes the affected environment for visual resources in the CHP Academy EIP project area, including regulatory and environmental setting.

4.16.1.1 Regulatory Setting

4.16.1.1.1 Local

The following local policies related to visual resources may apply to implementation of the CHP Academy EIP. Please see Section 3.14.2.1, Regulatory Setting, for a more complete description of each policy.

- *City of West Sacramento General Plan*
- *Yolo County General Plan*

4.16.1.2 Environmental Setting

This section discusses the environmental setting related to visual resources in the CHP Academy EIP project area.

4.16.1.2.1 Sacramento Bypass Levee

The Sacramento Bypass consists primarily of open space and flood conveyance land uses. No development or agricultural activities occur within the bypass. Agricultural land, planted with row crops, borders the Sacramento Bypass to the north, southwest, and west. The Sacramento River serves as its eastern boundary, and the CHP Academy and industrial land uses are located to the south. While few activities take place within the bypass (i.e., hunting occurs during the appropriate seasons), its levees are used for recreation.

Viewers using the levees of the bypass have expansive views that, when haze is at a minimum, extend over agricultural fields in the foreground to the middleground and background. The high-rise buildings of downtown Sacramento can be seen in the middleground, rising up above the tree line. Background views to the Sierra Nevada foothills to the east are rarer, while views of the Sutter Buttes to the north are more common. Some views are obscured by vegetation along the levees of the bypass and the CHP Academy, limited in certain directions to the foreground, depending on the viewer's location. Views also differ seasonally, offering more or fewer views when vegetation is dormant or in leaf.

While the visual quality of the bypass itself is moderate, the views offered from it are moderately high. Appealing views of the bypass and Sacramento cityscape present both rural and urban scenes that are attractive. Views from the Sacramento Bypass Levee are moderately high in vividness. The

artificial intrusions associated with the surrounding development and infrastructure are moderate, resulting in moderate intactness. The visual quality of the area is also moderate in unification because the landscape is disjunctive in its abrupt changes in land use.

4.16.1.2.2 Viewer Groups

The primary viewer groups in the CHP Academy study area are persons living or conducting business near levees; travelers using the interstates, highways, and smaller local roads (including those on levee crowns), those affiliated with Riverbank Elementary School; and recreationists (boaters, beachgoers, and fishermen using canals, creeks, and rivers; trail users; equestrians; bicyclists; joggers; etc.). All viewer groups have direct views of the study areas.

Residents

There are no residences in the immediate vicinity of the CHP Academy EIP project area. However, residents in Sacramento, across the Sacramento River from the project area, have limited views of the project area from their residences that are obstructed to varying degrees by riparian vegetation. Most suburban residences in the city of West Sacramento are located southeast of the site. Although there are no residences in the immediate vicinity, both suburban and rural residents in West Sacramento are likely to have a high sense of ownership over their waterways, the open space that surrounds them, the recreational opportunities they provide, and their inherent scenic quality. Because of their potential feeling of ownership, and exposure to project site views in transit or while enjoying recreation along the Sacramento Bypass Levee, these residents are considered to have high sensitivity to changes in the viewshed.

Businesses

There are no business facilities in the immediate vicinity of the CHP Academy project area. Viewers from the CHP Academy EIP have semi-permanent views of the project site from their facility some as close as about 100 feet away from the outer edge of the project's construction footprint. Views from the facility range from limited by trees or distance when viewing from the eastern side of the facility, to sweeping views that include the expanse of the Sacramento Bypass when viewing from the west side of the facility. Employees and users of this facility are likely to be occupied with their work activities and tasks at hand and less focused on taking advantage of their view. Due to limited viewing times and their focus on work-related tasks, this viewer group is considered to have moderate sensitivity to changes in views.

Roadways

The majority of roadway viewers would view the site from Old River Road, which runs perpendicular to the Sacramento Bypass Levee. Many people affiliated with the CHP Academy likely travel to and from the facility on this road. Views here are of the foreground, middleground, and background inclusive of the Sacramento Bypass, the Sacramento River, and the project site on the bypass levee.

Travelers use roadways at varying speeds; normal roadway speeds differ based on the traveler's familiarity with the route and roadway conditions (i.e., presence/absence of rain, sleet, etc.). Single views typically are of short duration; however, on roads that are very straight, such as Harbor Boulevard/Old River Road, views are longer.

Viewers who frequently travel routes generally possess moderate visual sensitivity to their surroundings. The passing landscape becomes familiar to these viewers, and their attention typically is not focused on the passing views but on the roadway, roadway signs, and surrounding traffic. Viewers who travel local routes for their scenic quality generally possess a higher visual sensitivity to their surroundings because they are likely to respond to the natural environment with a high regard and as a holistic visual experience. Furthermore, there are scenic stretches of roadway passing through the project area that offer sweeping views of the surrounding area that are of interest to motorists (such as the Sacramento River). For these reasons, viewer sensitivity is moderate among most roadway travelers.

Recreationists

Recreational users view the project area from waterways, roadways, trails, and from the levees themselves. Recreational uses consist of boating and fishing along the Sacramento River, hunting in the bypass, bird watching, walking, running, and jogging along the Sacramento Bypass Levee crown and nearby roads. Waterway users on the Sacramento River would largely have views of the riparian vegetation along the river corridor, obstructing their view of the project site. The vegetation present along the levees creates a softened, natural edge that is enjoyed by all recreationists. Local recreationists also have a high sense of ownership over the waterways and corridors they use for recreation (including levees), being that these areas are highly valued throughout the greater Sacramento area.

Viewer sensitivity is high among recreationists in the project area because they are more likely to value the natural environment highly, appreciate the visual experience, have a high sense of ownership, and be more sensitive to changes in views.

4.16.2 Environmental Consequences

This section describes the environmental consequences relating to visual effects for the proposed CHP Academy EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of the CHP Academy EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.14.3.3, Effects and Mitigation Measures.

4.16.2.1 Assessment Methods

The key effects were identified and evaluated based on the environmental characteristics of the CHP Academy EIP project area and the magnitude, intensity, and duration of activities related to the construction and operation of this project.

This evaluation of visual effects is based on:

- direct field observation from vantage points, including neighboring buildings, property, and roadways (conducted November 28, 2007, February 5, 2009, and Sept. 2009);
- photographic documentation of key views;
- professional standards (for discussion on these standards see Section 3.14.3.2.1);

- review of project construction drawings; and
- review of the project with regard to compliance with state and local ordinances and regulations and professional standards pertaining to visual quality.

4.16.2.2 Determination of Effects

For this analysis, an effect pertaining to visual resources was considered significant if it would result in any of the following environmental effects, which are based on professional practice and State CEQA Guidelines Appendix G (14 CCR 15000 *et seq*.):

- cause a substantial, demonstrable negative aesthetic effect on a scenic vista or view open to the public;
- substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
- substantially degrade the existing visual character or quality of the site and its surroundings; or
- create a new source of substantial light or glare that would adversely affect day or nighttime public views.

4.16.3 Effects and Mitigation Measures

4.16.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento Bypass Levee reach in the CHP Academy EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects relating to visual resources would occur. Therefore there would be no effect on this resource attributable to implementation of the No Action Alternative.

However, without levee improvements there is the continued risk of levee failure and levee deterioration would continue to occur, and the risk that the Sacramento Bypass Levee could fail due to seepage or slope stability or geometry issues would continue. Failure of the Sacramento Bypass Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Visual Resources program analysis (Section 3.14.3.3.1). A catastrophic levee failure would result in flooding and inundation that could significantly damage existing visual resources. Flood-fight or cleanup activities could introduce new visual elements into the project area. In addition, the bypass levee itself would be damaged irreparably or for an extended period of time which would remove a scenic vista the enjoyment derived by recreationists when viewing nature and wildlife scenery. Given the uncertainty of the occurrence or magnitude of such an event, potential effects on visual resources cannot be quantified based on available information.

Little to no vegetation will be removed at the CHP Academy EIP project area to comply with the USACE vegetation policy as there is very little woody vegetation within the specified corridor.

4.16.3.2 CHP Academy Applicant Preferred Alternative

Implementation of the CHP Academy APA would result in the following effects on visual resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
VIS-2: Create a New Source of Light or Glare	Significant	Significant and unavoidable	No feasible mitigation
VIS-4: Cause Temporary Visual Effects as a Result of Construction Activities	Less than significant	N/A	N/A

Effect VIS-2: Create a New Source of Light or Glare

The CHP Academy APA would not add any new permanent source of light or glare. It is expected that construction would occur at night, requiring temporary nighttime lighting. Equipment staging areas also would be lit at night for security reasons. Such nighttime lighting would be temporary through the duration of construction. The nearest residences to the CHP Academy APA project area are located to the east, across the Sacramento River in the Natomas Garden Highway area. There are also dormitories at the CHP academy, and the Academy also holds occasional nighttime training exercises. This would significantly affect the viewshed of the Garden Highway residents and CHP Academy attendees as they are not accustomed to nighttime glare of this degree. This effect would be significant and unavoidable.

Effect VIS-4: Cause Temporary Visual Effects as a Result of Construction Activities

CHP Academy APA construction activities would introduce considerable heavy equipment and associated vehicles into the views of residents in the Garden Highway area of Natomas, recreationists, motorists, and of the CHP Academy itself. The equipment would be visible throughout the construction season. Presence of the equipment would temporarily degrade the visual quality of the project area to low vividness, intactness, and unity.

Residential viewers in the Garden Highway area across the Sacramento River from the CHP Academy APA site are likely not accustomed to seeing construction activities and equipment, and sensitivity to such effects would be high. Other viewer groups are more accustomed to seeing construction activities and equipment from construction that has occurred in the business parks near the I Street Bridge, daily activities in the industrial areas, and local roadway construction projects and would have low sensitivity to construction effects.

However, because this effect is temporary, would last no longer than the construction duration, and is limited a small area, it would not substantially degrade the overall visual quality in the study area. In addition, the implementation of an environmental commitment to provide temporary construction barriers, as needed, between construction zones and residences, as described in Section 2.9 of Chapter 2, Alternatives, would make this effect less than significant.

In addition, effects on roadway users would be less than significant because of the short intervals of time that they are in visual contact with the program reaches and familiarity with construction along other roadways in the vicinity.

4.16.3.3 CHP Academy Alternative B

Implementation of the CHP Academy Alternative B would result in the following effects on visual resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
VIS-2: Create a New Source of Light or Glare	Significant	Significant and unavoidable	No feasible mitigation
VIS-4: Cause Temporary Visual Effects as a Result of Construction Activities	Less than significant	N/A	N/A

Effect VIS-2: Create a New Source of Light or Glare

This effect is the same as described above under the CHP Academy APA. The CHP Academy Alternative B would create a new source of light and glare that would result in a significant and unavoidable effect on local residents.

Effect VIS-4: Cause Temporary Visual Effects as a Result of Construction Activities

This effect is the same as described above under the CHP Academy APA. Construction of the CHP Academy Alternative B would temporarily degrade the visual quality of the project area to low vividness, intactness, and unity. However, because this effect is temporary, would last no longer than the construction duration, and is limited a small area, it would not substantially degrade the overall visual quality in the study area. In addition, the implementation of an environmental commitment to provide temporary construction barriers, as needed, between construction zones and residences, as described in Section 2.9 of Chapter 2, Alternatives, would make this effect less than significant.

Section 4.17
Recreation—
CHP Academy Early Implementation Project

4.17.1 Affected Environment

This section describes the affected environment for recreation in the CHP Academy EIP project area, including regulatory and environmental setting.

4.17.1.1 Regulatory Setting

4.17.1.1.1 Federal and State

No Federal or state plans, policies, regulations, or laws related to recreation resources apply to the CHP Academy EIP.

4.17.1.1.2 Local

The following local plans related to recreation apply to implementation of the CHP Academy EIP. Please see Section 3.14.2.1, Regulatory Setting, for a more complete description of each plan.

- *City of West Sacramento General Plan*
- *City of West Sacramento Parks Master Plan*
- *West Sacramento Bicycle and Pedestrian Path Master Plan*
- *Yolo County General Plan*

4.17.1.2 Environmental Setting

Very little known recreational use occurs in the vicinity of the Sacramento Bypass Levee. Occasional visitors park in the gravel area just south of the Sacramento Weir and west of Old River Road and walk into the Sacramento Bypass to fish (Shpak pers. comm. 2009). There are no formal recreation facilities on the Sacramento Bypass Levee.

4.17.2 Environmental Consequences

This section describes the environmental consequences relating to recreation resources for the CHP Academy EIP. It describes the methods used to determine the effects of the proposed project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of the CHP Academy EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.15.3.3, Effects and Mitigation Measures.

4.17.2.1 Assessment Methods

Effects on recreation related to implementation of the CHP Academy EIP were evaluated qualitatively. Generally, construction activities could result in a short-term loss of recreation opportunities by disrupting use of recreation areas or recreational boating corridors. A long-term effect could occur if a recreation opportunity is eliminated or the quality of that opportunity is severely reduced as a result of permanent program-related structures or operations. Long-term beneficial effects could occur if new or enhanced recreation opportunities are created through implementation of the project.

4.17.2.2 Determination of Effects

For this analysis, an effect pertaining to recreation was considered significant if it would result in any of the following environmental effects, which are based on professional practice and State CEQA Guidelines Appendix G (14 CCR 15000 *et seq*.):

- increase the use of existing neighborhood and regional parks or other recreation facilities such that substantial physical deterioration of the facility would occur or be accelerated;
- include recreation facilities or require the construction or expansion of recreation facilities that might have a significant physical effect on the environment;
- substantially restrict or reduce the availability or quality of existing recreation opportunities in the project vicinity; or
- implement operational or construction-related activities related to the placement of project facilities that would cause a substantial long-term disruption of any institutionally recognized recreation activities. Institutionally recognized recreation activities are those associated with an established publicly or privately operated recreation facility, or those actively administered or promoted by a public or private entity.

4.17.3 Effects and Mitigation Measures

4.17.3.1 No Action Alternative

The No Action Alternative would continue the existing deficiencies along the portion of the Sacramento Bypass Levee reach encompassed by the CHP Academy EIP project area (i.e., no levee improvements would be implemented). This means continued or even potentially increased risk that the Sacramento Bypass Levee could fail due to seepage or slope stability or geometry issues, Failure of the Sacramento Bypass Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the recreation program analysis (Section 3.15.3.3.1). A catastrophic levee failure would result in flooding and inundation that could significantly damage existing facilities and infrastructure and erode soil, uproot plants, and otherwise damage substrate by hydraulic force. This would render recreation facilities, informal recreation areas, and trails unusable until cleanup and restoration activities could be undertaken. It is possible that after a catastrophic flood event, recreation facilities may never be fully restored to their former condition, permanently reducing the quality and/or quantity of recreation opportunities in the area. In addition, scenic vistas for existing and future recreation facilities could be damaged irreparably or for an extended period of time which would reduce the enjoyment

derived by recreationists. Given the uncertainty of the occurrence or magnitude of such an event, potential effects on recreation cannot be quantified based on available information. Further discussion of the effects of the No Action Alternative is provided above in Program Environmental Consequences. Little to no vegetation will be removed at this EIP site to comply with the USACE vegetation policy under the No Action Alternative as there is very little woody vegetation within the specified corridor.

4.17.3.2 CHP Academy Applicant Preferred Alternative

Implementation of the CHP Academy APA would result in the following effects on recreation. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
REC-1: Temporary Disruption of Recreation Opportunities during Construction	Less than significant	N/A	N/A
REC-3: Long-Term Reduction in Quality of Existing Recreation Opportunities in the Levee Corridor	Less than significant	N/A	N/A
REC-6: Long-Term Increase in Recreation Opportunities	Beneficial	N/A	N/A

Effect REC-1: Temporary Disruption of Recreation Opportunities during Construction

No formal recreation facilities are located along the Sacramento Bypass Levee, although occasional visitors use the levee to access the bypass itself for fishing or wildlife viewing. Temporary disruption of access along the Sacramento Bypass Levee would occur during construction activities when the levee crown and adjacent construction and staging areas are closed to public access. Even if the recreation areas themselves are not closed, proximity to construction equipment and activities may degrade recreational experiences. However, this effect is temporary and there are alternative locations for fishing within the city. With implementation of the environmental commitment requiring notification of construction area closure to ensure public safety and provide closure notice in advance of construction activities (described in Section 2.9, Chapter 2, Alternatives), this effect would be less than significant. No mitigation is required.

Effect REC-3: Long-Term Reduction in Quality of Existing Recreation Opportunities in the Levee Corridor

The Sacramento Bypass Levee is, in general, already maintained to the new USACE standard for vegetation on levees, and full compliance with the policy would not require the removal of much additional woody vegetation. However, the proposed slope flattening would require the levee footprint to be expanded landward and therefore extend the zone that must be maintained free of woody vegetation. This may require removal of some mature trees from the CHP Academy APA project area. However, because the trees are part of an already marginal view of CHP Academy facilities and are currently inaccessible to visitors due to fencing, and because the Sacramento Bypass Levee is not known as a wildlife viewing spot, this effect would be less than significant. No mitigation is required.

Effect REC-6: Long-Term Increase in Recreation Opportunities

A paved pedestrian and bicycle trail would be constructed atop the Sacramento Bypass Levees as part of the CHP Academy APA. Although this segment is not part of the larger recreational corridor system proposed in the Parks Master Plan, this area is currently underutilized and construction of a trail in this area would improve recreation corridor connectivity and expand recreation opportunities in West Sacramento. It would also advance the policies of some of the planning documents listed above in the "Regulatory Setting" section. This effect is considered beneficial.

4.17.3.3 CHP Academy Alternative B

Implementation of the CHP Academy Alternative B would result in the following effects on recreation. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
REC-1: Temporary Disruption of Recreation Opportunities during Construction	Less than significant	N/A	N/A
REC-3: Long-Term Reduction in Quality of Existing Recreation Opportunities in the Levee Corridor	Less than significant	N/A	N/A
REC-6: Long-Term Increase in Recreation Opportunities	Beneficial	N/A	N/A

Effect REC-1: Temporary Disruption of Recreation Opportunities during Construction

This effect is the same as described above under the CHP Academy APA. With implementation of the environmental commitment requiring notification of construction area closure to ensure public safety and provide closure notice in advance of construction activities (described in Section 2.9, Chapter 2, Alternatives), temporary disruption of recreation opportunities at the CHP Alternative B site would be less than significant. No mitigation is required.

Effect REC-3: Long-Term Reduction in Quality of Existing Recreation Opportunities in the Levee Corridor

The Sacramento Bypass Levee is, in general, already maintained to the new USACE standard for vegetation on levees, and full compliance with the policy would not require the removal of much additional woody vegetation. However, the proposed stability berm would require the levee footprint to be expanded landward and therefore extend the zone that must be maintained free of woody vegetation. This may require removal of some mature trees from the CHP Academy Alternative B project area. However, because the trees are part of an already marginal view of CHP Academy facilities and are currently inaccessible to visitors due to fencing, and because the Sacramento Bypass Levee is not known as a wildlife viewing spot, this effect would be less than significant. No mitigation is required.

Effect REC-6: Long-Term Increase in Recreation Opportunities

This effect is the same as described above under the CHP Academy APA. This effect is considered beneficial.

Section 4.18
Utilities and Public Services—CHP Academy Early Implementation Project

4.18.1 Affected Environment

This section describes the affected environment for utilities and public services in the CHP Academy EIP project area, including regulatory and environmental setting.

4.18.1.1 Regulatory Setting

4.18.1.1.1 State

The following state policies or agencies related to utilities and public services may apply to implementation of the CHP Academy EIP. Please see Section 3.16.2.1, Regulatory Setting, for a more complete description of each policy.

- California Public Utilities Commission
- California Integrated Waste Management Act

4.18.1.1.2 Local

The following local policies related to utilities and public services may apply to implementation of the CHP Academy EIP. Please see Section 3.16.2.1, Regulatory Setting, for a more complete description of each policy.

- *City of West Sacramento General Plan*

4.18.1.2 Environmental Setting

This section discusses the environmental setting related to utilities and public services in the CHP Academy EIP project area.

4.18.1.2.1 Utilities and Service Systems

Table 4.18-1 lists aboveground and underground utilities in the CHP Academy EIP project area.

Table 4-18-1. Utilities Located in the CHP Academy Project Area

Approximate Stations	Utility	Size	Owner
14+00–64+78	Pole Line	N/A	PG&E
47+00–64+78	N/A	N/A	AT&T
50+50	Electric	N/A	PG&E
63+43	Culvert	30 inches	N/A
64+10	Electric	N/A	PG&E
64+10–64+78	Telephone Conduit	N/A	AT&T or Verizon
64+78	Fiber Optic Line	N/A	MCI, Level 3, Williams Communication

Source: HDR 2007 (Appendix D).

4.18.1.2.2 Public Services

Fire Protection

The City's Fire Department has the mission of protecting life, environment, and property within the city of West Sacramento. The primary fire station servicing the CHP EIP project area is Station 44 (Moore pers. comm.) It is open 24 hours a day, 7 days a week. Firefighters work 48-hour tours of duty (City of West Sacramento).

Police Protection

The Police Department provides a full range of police services to the residents of West Sacramento 24 hours a day, 7 days a week.

The Police Department is staffed with 75 sworn officers and 39 civilian full-time employees. Other positions include part-time police officers, parking enforcement officers, reserve police officers, and volunteers.

The department is broken into three geographic "beats". Beat 1 patrols the northern portion of the City including the Bryte and Broderick areas, and is responsible for the CHP Academy EIP project area. Beat 2 encompasses the central City along West Capitol Avenue and Beat 3 is responsible for the Southport area (Arsenault pers. comm.)

Emergency Medical Services

No hospitals are located within the city of West Sacramento. The nearest hospital is Sutter General Hospital, which is 3.7 miles from West Sacramento at 29th Street in Sacramento.

4.18.2 Environmental Consequences

This section describes the environmental consequences relating to utilities and public services for the proposed CHP Academy EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of the CHP Academy EIP, findings with or without mitigation,

and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.16.3.3, Effects and Mitigation Measures.

4.18.2.1 Assessment Methods

This evaluation of utilities and public services is based on information obtained from:

- review of relevant documents and Web sites to obtain information regarding known public services and utilities in the study area,
- analysis of geographic map research to determine locations of existing utilities and public services for program components, and
- telephone calls and e-mail correspondence to area utility/service providers.

4.18.2.2 Determination of Effects

For this analysis, an effect pertaining to utilities and public services was analyzed under NEPA and CEQA if it would result in any of the following environmental effects, which are based on NEPA standards, State CEQA Guidelines Appendix G (14 CCR 15000 *et seq.*), and standards of professional practice:

- require the construction or expansion of electrical or natural gas transmission or distribution facilities;
- require the construction or expansion of a water conveyance or wastewater treatment facility or require new or expanded water supply entitlements;
- require the construction of new or expanded stormwater drainage facilities;
- require the construction or expansion of wastewater treatment facilities;
- cause the capacity of a solid waste landfill to be reached sooner than it would without the program;
- require the construction or expansion of communications facilities (telephone, cell, cable, satellite dish);
- significantly affect public utility facilities that are located underground or aboveground along the local roadways from program construction activities;
- create an increased need for new fire protection, police protection, or ambulance services or significantly affect existing emergency response times or facilities; or
- intersect with major infrastructure components, such as bridges or overpasses, requiring relocation of the components.

4.18.3 Effects and Mitigation Measures

4.18.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento Bypass Levee reach in the CHP Academy EIP project area. No levee improvements

would be made to increase the level of protection. No construction-related effects relating to utilities or service systems would occur and none of these services would therefore be interrupted or damaged. Therefore, there would be no effect on this resource under the No Action Alternative.

However, because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento Bypass Levee could fail due to seepage or slope stability and geometry issues would continue. Failure of the Sacramento Bypass Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Utilities and Public Services program analysis (Section 3.16.3.3.1).

In summary, those effects could include destruction, damage, or contamination of water delivery infrastructure, utility lines, water or wastewater piping .Varying levels of damage could be done to public service structures as well, causing delays in response from fire and police protection and delays in commuting to the nearest hospital to seek medical attention.

4.18.3.2 CHP Academy Applicant Preferred Alternative

Implementation of the CHP Academy APA would result in the following effects on utilities and public services. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect PUB-1: Damage of Public Utility Infrastructure and Disruption of Service	Significant	Less than significant	PUB-MM-1: Verify Utility Locations, Coordinate with Utility Providers, Prepare a Response Plan, and Conduct Worker Training
Effect PUB-2: Exceed the Capacity or Shorten the Lifespan of Local Solid Waste Landfills as a Result of Construction	Less than significant	N/A	N/A

Effect PUB-1: Damage of Public Utility Infrastructure and Disruption of Service

Construction of the CHP Academy APA could necessitate the relocation of utility infrastructure, which could result in temporary loss of service. As described above in the Environmental Setting section, existing infrastructure within the CHP Academy APA project site includes telephone lines, electric lines, fiber optic lines, and a culvert.

Utility infrastructure could require significant actions to repair, relocate, or replace. Additionally, CHP Academy APA construction could necessitate that existing utilities be taken off line or could cause accidental damage to identified and unidentified infrastructure. Because the potential exists for damage and service interruptions to existing utilities, this potential construction effect is considered significant. Mitigation Measure PUB-MM-1 would reduce this potential effect to a less-than-significant level.

Mitigation

Mitigation Measure PUB-MM-1: Verify Utility Locations, Coordinate with Utility Providers, Prepare a Response Plan, and Conduct Worker Training

WSAFCA will ensure the following measures are implemented to avoid and minimize potential damage to utility and service disruptions during construction. Implementing these measures will help ensure existing utilities are not damaged and that service interruptions are minimized.

- Obtain utility excavation or encroachment permits as necessary before initiating any work with the potential to affect utility lines, and include all necessary permit terms in construction contract specifications.
- Before starting construction, coordinate with utility providers in the area to locate existing lines. Avoid the relocation of utilities when possible. Provide notification of potential interruptions in services to the appropriate agencies.
- Before starting construction, verify utility locations through field surveys and Underground Service Alerts. Clearly mark any buried utility lines in the area of construction before any earthmoving activity.
- Before starting construction, prepare a response plan to address potential accidental damage to a utility line. The plan will identify chain-of-command rules for notifying authorities and appropriate actions and responsibilities to ensure the safety of the public and the workers. Contractors will conduct worker training to respond to these situations.
- Stage utility relocations to minimize service interruptions.

Effect PUB-2: Exceed the Capacity or Shorten the Lifespan of Local Solid Waste Landfills as a Result of Construction

Implementation of the CHP Academy APA may generate up to 89,000 cubic yards of levee material that would require disposal. A portion of the material could be disposed of on-site and used for new levee construction, as long as it is suitable material. Disposal of the soil material would occur if soil characteristics make it infeasible for reuse as levee material, or the soil is determined to have contaminants that would require appropriate disposal. Embankment fill material excavated to construct levee improvements would be evaluated for reuse after excavation and prior to disposal. Soil requiring disposal as part of the CHP Academy APA would likely be transported to the Yolo County Central Landfill; however, the location of the landfill used for disposal of spoil material and other construction-related waste may be determined by the construction contractor at the time of construction activity based on capacity, type of waste, and other factors. Only those landfills determined to have the ability to accommodate the construction disposal needs of the CHP Academy APA would be used.

As of fall 2009, the remaining capacity for the Yolo County Central Landfill is 37,108,000 cubic yards. Some of the disposed soils may be deemed suitable by the Yolo County Central Landfill for other beneficial uses. These soils would only be temporarily stored at the landfill and would not have an effect on its overcall capacity. The current landfill closure projection is in 2070, which takes into account disposal growth rate, including both beneficial and non-beneficial soil materials. Assuming all of the estimated 89,000 cubic yards of soil would require permanent disposal, CHP Academy APA implementation would represent less than 1% of the remaining capacity of the Yolo County Central Landfill. However, the option of beneficial re-use is likely to reduce the cubic yards of

soil that require permanent disposal. These facts combined with the fact that the landfill has sufficient capacity remaining throughout the projected life of the WSLIP (15 to 20 years), would make this effect less than significant. No mitigation is required. (Borrego pers. comm.).

4.18.3.3 CHP Academy Alternative B

Implementation of the CHP Academy Alternative B would result in the following effects on utilities and public services. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect PUB-1: Damage of Public Utility Infrastructure and Disruption of Service	Significant	Less than significant	PUB-MM-1: Verify Utility Locations, Coordinate with Utility Providers, Prepare a Response Plan, and Conduct Worker Training
Effect PUB-2: Exceed the Capacity or Shorten the Lifespan of Local Solid Waste Landfills as a Result of Construction	Less than significant	N/A	N/A
Effect PUB-3: Expansion of Stormwater Drainage Facilities	Less than significant	N/A	N/A

Effect PUB-1: Damage of Public Utility Infrastructure and Disruption of Service

This effect is the same as described above under the CHP Academy APA. The CHP Academy Alternative B could result in damage or service interruptions to existing utilities. This potential construction effect is considered significant. Mitigation Measure PUB-MM-1 would reduce this potential effect to a less- than-significant level.

Mitigation

Mitigation Measure PUB-MM-1: Verify Utility Locations, Coordinate with Utility Providers, Prepare a Response Plan, and Conduct Worker Training

Effect PUB-2: Exceed the Capacity or Shorten the Lifespan of Local Solid Waste Landfills as a Result of Construction

Implementation of the CHP Academy Alternative B may generate up to 11,000 cubic yards of levee material that would require disposal. A portion of the material could be disposed of on-site and used for new levee construction, as long as it is suitable material. Disposal of the soil material would occur if soil characteristics make it infeasible for reuse as levee material, or the soil is determined to have contaminants that would require appropriate disposal. Embankment fill material excavated to construct levee improvements would be evaluated for reuse after excavation and prior to disposal. Soil requiring disposal as part of the CHP Academy Alternative B would likely be transported to the Yolo County Central Landfill; however, the location of the landfill used for disposal of spoil material and other construction-related waste may be determined by the construction contractor at the time of construction activity based on capacity, type of waste, and other factors. Only those landfills determined to have the ability to accommodate the construction disposal needs of the CHP Academy Alternative B would be used.

As of fall 2009, the remaining capacity for the Yolo County Central Landfill is 37,108,000 cubic yards. Some of the disposed soils may be deemed suitable by the Yolo County Central Landfill for other beneficial uses. These soils would only be temporarily stored at the landfill and would not have an effect on its overcall capacity. The current landfill closure projection is in 2070, which takes into account disposal growth rate, including both beneficial and non-beneficial soil materials. Assuming all of the estimated 11,000 cubic yards of soil would require permanent disposal, CHP Academy Alternative B implementation would represent less than 1% of the remaining capacity of the Yolo County Central Landfill. However, the option of beneficial re-use is likely to reduce the cubic yards of soil that require permanent disposal. These facts combined with the fact that the landfill has sufficient capacity remaining throughout the projected life of the WSLIP (15 to 20 years), would make this effect less than significant. No mitigation is required. (Borrego pers. comm.).

Effect PUB-3: Expansion of Stormwater Drainage Facilities

The operation of the proposed relief wells would result in new flows to the existing stormwater drainage facilities. In the case of CHP Academy Alternative B, there is sufficient capacity in the existing adjacent drainage ditch and pump station to pump the relief well discharge back into the Sacramento Bypass (see Section 4.3 CHP Academy Alternative B Project Description). Implementation of the CHP Academy Alternative B would therefore not require the construction of new drainage facilities. This effect is less than significant. No mitigation is required.

Section 4.19
Public Health and Environmental Hazards—CHP Academy Early Implementation Project

4.19.1 Affected Environment

This section describes the affected environment for public health and environmental hazards in the CHP Academy EIP project area, including regulatory and environmental setting.

4.19.1.1 Regulatory Setting

This section discusses the regulatory setting related to public health and environmental hazards in the CHP Academy EIP project area.

4.19.1.1.1 Federal

The following Federal policies related to public health and environmental hazards may apply to implementation of the CHP Academy EIP. Please see Section 3.17.2.1 Regulatory Setting for a more complete description of each policy.

- Resource Conservation and Recovery Act
- Comprehensive Environmental Response, Compensation, and Liability Act

4.19.1.1.2 State

The following state policies related to public health and environmental hazards may apply to implementation of the CHP Academy EIP. Please see Section 3.17.2.1 Regulatory Setting for a more complete description of each policy.

- Hazardous Materials Release Response Plans and Inventory Act of 1985
- Hazardous Waste Control Act
- Emergency Services Act

4.19.1.1.3 Local

The following local policies related to public health and environmental hazards may apply to implementation of the CHP Academy EIP. Please see Section 3.17.2.1 Regulatory Setting for a more complete description of each policy.

- *Draft 2030 Countywide General Plan* for Yolo County, Health and Safety Element
- *City of West Sacramento General Plan*

4.19.1.2 Environmental Setting

This section discusses the environmental setting related to public health and environmental hazards in the CHP Academy EIP project area.

4.19.1.2.1 Hazardous Materials

Hazardous materials are chemicals and other substances defined as hazardous by federal and state laws and regulations. In general, these materials are substances that, because of their quantity, concentration, or physical, chemical, or infectious characteristics, may have harmful effects on public health or the environment during their use or when released to the environment. Hazardous materials also include waste chemicals and spilled materials. There are no known occurrences of hazardous materials at the CHP Academy EIP project area.

4.19.1.2.2 Wildland Fires

The area surrounding the CHP Academy EIP project site is not considered a fire-prone area.

4.19.1.2.3 Emergency Response and Evacuation

Emergency response and evacuation services for the project area are provided by the various departments in the City of West Sacramento and through Yolo County Sheriff, Fire, and Emergency Services Departments. The City of West Sacramento and RD 537 have entered a joint flood operation agreement. The agreement has established procedures to protect the health, safety, welfare and property of the residents and landowners in the program area. Procedures described in the agreement document consist of flood preparedness, information management, monitoring, flood fighting, and flood evacuation.

4.19.1.2.4 Schools

There are no schools located within 0.25 mile of the CHP Academy project area. This is relevant because the State CEQA Guidelines advise that hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school could constitute a significant environmental effect.

4.19.2 Environmental Consequences

This section describes the environmental consequences relating to public health and environmental hazards for the proposed CHP Academy EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of the CHP Academy EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.17.3.3, Effects and Mitigation Measures.

4.19.2.1 Assessment Methods

The evaluation of potential effects on public health and environmental hazards addresses the potential for health and safety hazards during construction of the CHP Academy EIP levee alternatives. The analysis includes evaluation of (1) the potential effects related to construction activities on workers, and (2) general safety of and hazards to both workers and the public posed by the construction and implementation of the levee alternatives.

4.19.2.2 Determination of Effects

Criteria used for determining the significance of an effect on public health and environmental hazards are based on the environmental checklist included in Appendix G (14 CCR 15000 *et seq*.) of the State CEQA Guidelines as well as professional standards and practices. The proposed project was considered to cause a significant effect if it would:

- create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
- create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials to the environment;
- emit hazardous emissions or involve handling hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school;
- be located on a site that is on a list of hazardous materials sites compiled pursuant to California Government Code 65962.5, and as a result would create a significant hazard to the public or the environment;
- impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan;
- place within a 100-year flood hazard area structures that would impede or redirect flood flows;
- expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam; or
- significantly affect drinking water quality.

4.19.3 Effects and Mitigation Measures

4.19.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento Bypass Levee reach in the CHP Academy EIP project area. No levee improvements would be made to increase the level of protection.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento Bypass Levee could fail due to seepage or slope stability or geometry issues would continue. Failure of the Sacramento Bypass Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Public Health and Hazards program analysis (Section 3.17.3.3.1). In summary, those effects could include creation of hazardous conditions for the public and environment through the spread of hazardous materials, structural damage to homes and other buildings, damage to electrical and gas delivery systems, and contamination of the water supply. Receding floodwaters could also leave behind dangerous strains of mold and serve as breeding grounds for mosquitoes and other disease vectors. A major flood event could also disrupt or place severe strain on critical public services such as fire protection, police protection, and emergency medical assistance.

4.19.3.2 CHP Academy Applicant Preferred Alternative

Implementation of the CHP Academy APA would result in the following effects on public health and environmental hazards. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
PH-1: Incidental Release of Hazardous Materials during Construction	Less than significant	N/A	N/A
PH-2: Exposure to Hazardous Materials Encountered at Project Site	Significant	Less than significant	WQ-MM-1: Implement Measures to Maintain Surface Water Quality and Groundwater Quality WQ-MM-2: Implement Provisions for Dewatering PH-MM-1: Complete Phase I and Phase II (If Necessary) Environmental Site Assessment Investigations and Implement Required Measures
PH-3: Safety Hazards from the Construction Site and Vehicles	Less than significant	N/A	N/A
PH-4: Protection of People or Structures from Flood Hazards	Beneficial	N/A	N/A

Effect PH-1: Incidental Release of Hazardous Materials during Construction

CHP Academy APA implementation would require the use of hazardous materials such as fuels and lubricants to operate construction equipment and vehicles such as excavators, compactors, haul trucks, and loaders. Bentonite (a non-hazardous material) would be transported to sites where slurry cutoff wall construction would occur. Construction contractors would be required to use, store, and transport hazardous materials in compliance with Federal, state, and local regulations during project construction. However, fuels, and lubricants could be accidentally released into the environment at the construction site and along haul routes, causing environmental or human exposure to these hazards. Risks to water quality (surface, ground, and drinking water) associated with incidental release of these materials are addressed in Section 4.5, Water Quality and Groundwater Resources.

As discussed in Section 4.5, the implementation of environmental commitments, including a SWPPP, a bentonite slurry spill contingency plan (BSSCP), an SPCCP, and the implementation of Mitigation Measures WQ-MM-1 and WQ-MM-2, would ensure that the risk of accidental spills and releases into the environment would be minimal and that the effect on water quality would be less than significant.

In addition, WSAFCA would be required to comply with applicable Federal, state, and local laws, which would reduce the potential for accidental release of hazardous materials during their transport and use. Consequently, the risk of incidental release of hazardous materials during their transport and use in CHP Academy APA construction activities is low and the effect is considered less than significant.

Effect PH-2: Exposure to Hazardous Materials Encountered at Project Site

There is the potential that known or previously undocumented hazardous materials could be encountered at the CHP Academy APA project site. Excavation and construction activities at or near areas of currently unrecorded soil or groundwater contamination could result in the exposure of construction workers, the general public, and the environment to hazardous materials such as petroleum hydrocarbons, pesticides, herbicides, fertilizers, contaminated debris, or elevated levels of other chemicals that could be hazardous. At this time, there are no known occurrences of hazardous materials at the CHP Academy APA project area. However, construction activities in the vicinity of potentially unknown recognized environmental concerns could result in public health hazards.

Implementation of Mitigation Measures PH-MM-1, WQ-MM-1, and WQ-MM-2 described in Section 4.5, Water Quality and Groundwater Resources, and the implementation of environmental commitments of a SWPPP, a BSSCP, and SPCCP, as described in Section 2.9 of Chapter 2, Alternatives, would ensure that the effect on public health and the environment would be less than significant.

Mitigation

Mitigation Measure WQ-MM-1 Implement Measures to Maintain Surface Water Quality and Groundwater Quality

Mitigation Measure WQ-MM-2: Implement Provisions for Dewatering

Mitigation Measure PH-MM-1: Complete Phase I and Phase II (If Necessary) Environmental Site Assessment Investigations and Implement Required Measures

WSAFCA will conduct Phase I ESAs and, if necessary, Phase II ESAs or other appropriate testing. If necessary, the assessment will include an analysis of soil or groundwater samples for the potential contamination sites that have not yet been covered by previous investigations before construction activities begin.

Recommendations in Phase I and Phase II ESAs to address any contamination that is found will be implemented before initiating ground-disturbing activities. In addition, WSAFCA will implement the following measures before ground-disturbing or demolition activities begin, in order to reduce health hazards associated with potential exposure to hazardous substances:

- Prepare a site plan that identifies any necessary remediation activities appropriate for proposed land uses, including excavation and removal of contaminated soils, and redistribution of clean fill material on the project site. The plan will include measures that ensure the safe transport, use, and disposal of contaminated soil and building debris removed from the site, as well as any other hazardous materials. In the event that contaminated groundwater is encountered during site excavation activities, the contractor will report the contamination to the appropriate regulatory agencies, dewater the excavated area, and treat the contaminated groundwater to remove contaminants before discharge into the sanitary sewer system. The contractor will be required to comply with the plan and applicable Federal, state, and local laws.
- Retain licensed contractors to remove all underground storage tanks.
- Notify the appropriate Federal, state, and local agencies if evidence of previously undiscovered soil or groundwater contamination is encountered during construction activities. Any

contaminated areas will be cleaned up in accordance with the recommendations of Yolo County Environmental Health Division, Central Valley RWQCB, California Department of Toxic Substances Control, or other appropriate Federal, state or local regulatory agencies.,

- Prepare a worker health and safety plan before the start of construction activities that indentifies, at a minimum, all contaminants that could be encountered during construction activity; all appropriate worker, public health, and environmental protection equipment and procedures to be used during project activities; emergency response procedures; the most direct route to the nearest hospitals; and a Site Safety Officer. The plan will describe actions to be taken should hazardous materials be encountered on site, including protocols for handling hazardous materials and preventing their spread, and emergency procedures to be taken in the event of a spill.

Effect PH-3: Safety Hazards from the Construction Site and Vehicles

Under the CHP Academy APA, construction workers would operate vehicles and other mechanical equipment that, if used improperly, could result in safety hazards at the construction site. WSAFCA would ensure that all workers are properly trained to operate equipment. Safety precautions would be followed at all times during construction to avoid accidents. WSAFCA also would require that all workers have a valid driver's license and insurance. These measures would ensure that this effect would be less than significant.

In addition, people may walk, ride bicycles, or otherwise use the levee during the construction period. The staging of the equipment when construction is not underway (i.e., weekends, holidays, or overnight, if construction is not performed 24 hours per day) may pose a threat to public safety if the equipment is not properly secured. Proper signage and detours would be provided as stated in the environmental commitment to provide notification of construction area closure (described in Section 2.9, Chapter 2, Alternatives). These measures would reduce the risk to the public when construction is underway and when it is not. Therefore, this effect would be less than significant. No mitigation is required.

Effect PH-4: Protection of People or Structures from Flood Hazards

All levees have the potential to fail, regardless of design. USACE has set forth guidelines for levee design. Under the CHP Academy APA, the Sacramento Bypass Levee would be improved using methods that meet engineering requirements set forth by both USACE and the Reclamation Board. In addition, this levee would be improved to meet FEMA 200-year flood protection certification. This would be an improvement compared to the existing level of flood protection. Therefore, this effect would be beneficial.

4.19.3.3 CHP Academy Alternative B

Implementation of the CHP Academy Alternative B would result in the following effects on public health and environmental hazards. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
PH-1: Incidental Release of Hazardous Materials during Construction	Less than significant	N/A	N/A
PH-2: Exposure to Hazardous Materials Encountered at Project Site	Significant	Less than significant	WQ-MM-1: Implement Measures to Maintain Surface Water Quality and Groundwater Quality WQ-MM-2: Implement Provisions for Dewatering PH-MM-1: Complete Phase I and Phase II (If Necessary) Environmental Site Assessment Investigations and Implement Required Measures
PH-3: Safety Hazards from the Construction Site and Vehicles	Less than significant	N/A	N/A
PH-4: Protection of People or Structures from Flood Hazards	Beneficial	N/A	N/A

Effect PH-1: Incidental Release of Hazardous Materials during Construction

CHP Academy Alternative B implementation would require the use of hazardous materials such as fuels and lubricants to operate construction equipment and vehicles such as excavators, compactors, haul trucks, and loaders. Construction contractors would be required to use, store, and transport hazardous materials in compliance with Federal, state, and local regulations during project construction. However, fuels, and lubricants could be accidentally released into the environment at the construction site and along haul routes, causing environmental or human exposure to these hazards. Risks to water quality (surface, ground, and drinking water) associated with incidental release of these materials are addressed in Section 4.5, Water Quality and Groundwater Resources.

As discussed in Section 4.5, the implementation of environmental commitments, including a SWPPP, an SPCCP, and the implementation of Mitigation Measures WQ-MM-1 and WQ-MM-2, would ensure that the risk of accidental spills and releases into the environment would be minimal and that the effect on water quality would be less than significant.

In addition, WSAFCA would be required to comply with applicable Federal, state, and local laws, which would reduce the potential for accidental release of hazardous materials during their transport and use. Consequently, the risk of incidental release of hazardous materials during their transport and use in CHP Academy Alternative B construction activities is low and the effect is considered less than significant.

Effect PH-2: Exposure to Hazardous Materials Encountered at Project Site

This effect is the same as described above under the CHP Academy APA. There is the potential that known or previously undocumented hazardous materials could be encountered at the CHP Academy Alternative B project site that could result in the exposure of construction workers, the general

public, and the environment to hazardous materials. Implementation of Mitigation Measures PH-MM-1, WQ-MM-1, and WQ-MM-2 described in Section 4.5, Water Quality and Groundwater Resources, and the implementation of environmental commitments of a SWPPP and SPCCP, as described in Section 2.9 of Chapter 2, Alternatives, would ensure that the effect on public health and the environment would be less than significant.

Mitigation

Mitigation Measure WQ-MM-1 Implement Measures to Maintain Surface Water Quality and Groundwater Quality

Mitigation Measure WQ-MM-2: Implement Provisions for Dewatering

Mitigation Measure PH-MM-1: Complete Phase I and Phase II (If Necessary) Environmental Site Assessment Investigations and Implement Required Measures

Effect PH-3: Safety Hazards from the Construction Site and Vehicles

This effect is the same as described above under the CHP Academy APA. Under implementation of the CHP Academy Alternative B, construction workers would operate vehicles and other mechanical equipment that, if used improperly, could result in safety hazards at the construction site. WSAFCA would ensure that safety precautions would be followed at all times during construction to avoid accidents. This effect would be less than significant. No mitigation is required.

Effect PH-4: Protection of People or Structures from Flood Hazards

This effect is the same as described above under the CHP Academy APA. Under the CHP Academy Alternative B, the Sacramento Bypass Levee would be improved using methods that meet engineering requirements set forth by both USACE and the Reclamation Board. In addition, this levee would be improved to meet FEMA 200-year flood protection certification. This would be an improvement compared to the existing level of flood protection. Therefore, this effect would be beneficial.

Section 4.20
Cultural Resources—CHP Academy Early Implementation Project

4.20.1 Affected Environment

This section describes the affected environment for cultural resources in the CHP Academy EIP project area, including the regulatory and environmental setting.

4.20.1.1 Regulatory Setting

4.20.1.1.1 Federal

The following Federal policies related to cultural resources may apply to the implementation of the CHP Academy EIP. Please see the program information in Section 3.18.2.1, Regulatory Setting, for a more complete description of each policy.

- Section 106 of the National Historic Preservation Act
- Federal Historic Significance Criteria

4.20.1.1.2 State

The following state policy related to cultural resources may apply to the implementation of the CHP Academy EIP. Please see Section 3.18.2.1, Regulatory Setting, for a more complete description of each policy.

- State Historic Significance Criteria (14 CCR 15064.5(a)(3)(A-D))

4.20.1.1.3 Local

The following local policies related to cultural resources may apply to the implementation of the CHP Academy EIP. Please see Section 3.18.2.1, Regulatory Setting, for a more complete description of each policy.

- *Yolo County General Plan*
- *City of West Sacramento General Plan*

4.20.1.2 Environmental Setting

This section discusses the environmental setting related to cultural resources in the project study area for the CHP Academy EIP including the records searches and field survey methods used to evaluate cultural resource conditions, and a summary of known cultural resources.

4.20.1.2.1 Records Search

In October 2007, ICF Jones & Stokes staff requested a search of database files from both the Northwest Information Center and the North Central Information Center of the California Historical Resources Information System located at California State University, Sacramento and Sonoma State respectively (see 3.18.3.1, Methods).

The records search resulted in the findings that all of the CHP Academy EIP project area has been surveyed for the presence of cultural resources (Bouey with Herbert 1990; Glover and Bouey 1990; Huberland and Westwood 2001; U.S. Army Corps of Engineers 2006; Wilson 1978). However, only portions of the CHP Academy EIP project area have been surveyed within the last 10 years, necessitating a new survey in support of the proposed project (see Field Survey below).

The records search also resulted in the finding that two known cultural resources are located within the CHP Academy project area: YOL-HRI-8/242 (Sacramento Weir and Sacramento Bypass) and the Sacramento River Levee. No previously recorded resources are located within 0.25 mile of the project area.

4.20.1.2.2 Shipwrecks Database

ICF Jones & Stokes consulted the California State Lands Commission's Shipwrecks Database (2009) to determine whether historic shipwrecks may be present in the CHP Academy EIP project area. The database was searched by selecting Yolo County in the search field, which generated a list of 12 shipwrecks in Yolo County. The database search yielded latitude and longitude coordinates for 11 of the shipwrecks, which were plotted using an online mapping program (http://www.itouchmap.com/latlong.html) to determine whether any of the shipwrecks were in the project area.

The wreck of the side-wheel steamer *Alviso*, burned at Brytes Bend on December 15, 1920, may be present in the project vicinity (California State Lands Commission 1988: 109).

4.20.1.2.3 Field Survey

In October 2007, an ICF Jones & Stokes archaeologist conducted a reconnaissance-level survey of the proposed project area. Although the records search indicated that the project area had been previously surveyed, an additional reconnaissance review of the project area was deemed necessary to confirm the previous findings and to confirm coverage of the entire project area. The project area is located within heavily a developed area of West Sacramento and very little, if any, natural ground surface remains. The project area has been graded, landscaped, and developed. No previously unidentified archaeological resources were noted within the project area as a result of the reconnaissance-level survey.

On February 5 and March 10, 2008, an ICF Jones & Stokes architectural historian conducted a field survey of the project area. As part of the field process, buildings, structures, and linear features 45 years old[1] or older were inspected, photographed, and documented (see Summary of Known Cultural Resources below).

[1] Although the NRHP typically only considers properties that are 50 years or older for listing, the Office of Historic Preservation (1995:2) employs a 45-year threshold for the recordation of cultural resources because "there is commonly a five year lag between resource identification and the date that planning decisions are made."

4.20.1.2.4 Native American Consultation

In January 2008, ICF Jones & Stokes cultural resources staff contacted the Native American Heritage Commission (NAHC) to request a search of their Sacred Lands File. The NAHC staff responded in January 2008 with a list of Native American contacts for both Yolo and Solano Counties and the results of the sacred lands data base research that was negative for findings in the CHP Academy EIP project area.

The NAHC contact list included the following federally recognized Native American tribes:

- Rumsey Indian Rancheria of Wintun Indians
- Cortina Band of Wintun Indians (including the Wintun Environmental Protection Agency)
- Ione Band of Miwok Indians

The NAHC also provided contact information for the following federally non-recognized Native American group and individual:

- Kesner Flores
- Wilton Miwok Rancheria

ICF Jones & Stokes staff sent letters to the Native American contacts on the lists provided by NAHC. The correspondence included a map depicting the program corridor, a brief description of the proposed program, and a request for the contacts to share any knowledge or concerns they may have regarding cultural resources in or adjacent to the study area. ICF Jones & Stokes received a letter response dated April 2008 from Mr. Marshall McKay, Tribal Chairman for the Rumsey Band of Wintun Indians. Mr. McKay's letter stated his gratitude for the letter notification about the proposed levee alternatives and that he was not aware of any sites of religious or cultural importance in the program corridor. Mr. McKay also stated that the Rumsey Indian Rancheria of Wintun would like to be notified of any cultural finds unearthed during construction actions. ICF Jones & Stokes staff placed follow-up telephone calls to the letter recipients on June 5, 2009. Voice messages were left with the contacts. To date, no return phone calls have been received.

4.20.1.2.5 Additional Research and Consultation

In an effort to identify important historic people, events, and trends that may have been associated with the project area, an ICF Jones & Stokes historian conducted archival research at the California State Library and the California State Archives, Sacramento. ICF Jones & Stokes also sent project notification letters to the Yolo County Historical Museum, the Yolo County Historical Society, the Sacramento Archives and Museum Collection Center, and the Portuguese Historical and Cultural Society requesting information regarding cultural resources that may be located within the project area. No responses have been received to date.

4.20.1.2.6 Summary of Known Cultural Resources

Three cultural resources 45 years old or older were identified in or immediately adjacent to the CHP Academy site. These consist of HRI-8/242 (Sacramento Weir and Sacramento Bypass), the Sacramento River Levee, and a segment of the Sacramento Northern Railroad. HRI-8/242 is eligible for NRHP and CRHR listing (Les 1986). The two remaining resources (the levee and railroad segment) were evaluated for the NRHP and CRHR as part of this project. The results of the survey

and evaluation of the architectural resources are documented in the technical report prepared for this project and are summarized below.

HRI-8/242 (the Sacramento Weir and Sacramento Bypass)

The Sacramento Weir and Sacramento Bypass were constructed between 1916 and 1918 as part of the Sacramento Flood Control Project. The weir is located immediately adjacent to the proposed project on the west bank of the Sacramento River. The Sacramento Bypass is a diversion channel that extends nearly 2 miles west from the weir and Sacramento River. Earthen levees are located on either side of the bypass. The weir and bypass have been determined to be eligible under NRHP Criterion A and CRHR Criterion 1 for their role in Sacramento Valley flood control efforts (Jones & Stokes 2007: 5; Les 1986: 2; Office of Historic Preservation 2007: 14).

Sacramento River Levee

A segment of the Sacramento River Levee is located in the CHP Academy EIP project area. The Sacramento River Levee is an earthen levee extending in a roughly north-south direction along the west bank of the Sacramento River. The Sacramento River Levee is part of a conglomeration of water control structures constructed in the Sacramento Valley between the mid-19th and mid-20th century as a response to heavy flooding in the area, which occurred repeatedly between the 1850s and early 1910s. Construction and improvements on the levee began as early as the 1860s and continued until the early to mid-20th century as increasing development in the area led to a greater need for more substantial and extensive levees. The Sacramento River Levee appears to meet NRHP Criterion A and CRHR Criterion 1 for its association with flood control and water reclamation efforts in California.

Sacramento Northern Railroad Segment

A former Sacramento Northern Railway alignment travels through the CHP Academy EIP project area in a roughly north-south direction and parallel to the Sacramento River West/North Levee segment of the Sacramento levee system. The Sacramento Northern Railroad alignment was originally constructed in 1911 as part of the Sacramento and Woodland Railroad and later the Northern Electric Railroad. In 1918, Sacramento Northern Railway assumed ownership, which resulted in the incorporation of all electric lines in the Sacramento Valley. Over time, portions of the rail alignment, including the subject segment, were abandoned. Due to a lack of integrity, the railroad segment does not appear to meet NRHP or CRHR criteria.

4.20.2 Environmental Consequences

This section describes the environmental consequences relating to cultural resources in the proposed CHP Academy EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of the CHP Academy EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.16.3.3, Effects and Mitigation Measures.

4.20.2.1 Assessment Methods

Evaluation of effects on cultural resources is based on information provided by literature review, records searches, historic map research, and consultation with Native Americans. This information was then compared to the type and location of proposed flood control and recreation improvements to determine whether effects would occur.

4.20.2.2 Determination of Effects

4.20.2.2.1 Federal Criteria

According to 36 CFR 800.5, an undertaking would have an adverse effect on historic properties if the effect alters the characteristics[2] that make a property eligible for inclusion in the NRHP. Such effects also would be considered adverse under NEPA. Adverse effects can occur when prehistoric or historic archaeological sites, structures, or objects listed in or eligible for listing in the NRHP are subjected to the following phenomena:

- physical destruction of or damage to all or part of the property;
- alteration of the property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation, and provision of handicapped access, that is not consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties (36 CFR 68) and applicable guidelines;
- removal of the property from its historic location;
- change in the character of the property's use or of physical features within the property's setting that contribute to its historic significance;
- introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features;
- neglect of the property that causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to a Native American tribe or Native Hawaiian organization; or
- transfer, lease, or sale of the property out of Federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance.

4.20.2.2.2 State Criteria

CEQA defines a significant impact on cultural resources in 14 CCR 15064.5(b) (1) and (2) as one with the potential to cause a substantial adverse change in the significance of a historical resource or unique archaeological resource. Substantial adverse change in the significance of a resource means the physical demolition, destruction, relocation, or alteration of the resource or its immediate

[2] Cultural resource managers often refer to these characteristics as character-defining elements or features. Character-defining features are those characteristics of a historic property, historical resource, or unique archaeological resource that convey its significance; the loss of character-defining elements impedes a property's ability to convey its historical significance. The importance of character-defining elements in cultural resource assessments is made clear in *National Register* Bulletin 15, which mentions "character" in this context 42 times (Andrus and Shrimpton 1997).

surroundings such that the significance of the resource would be materially impaired. The significance of a historical resource is materially impaired when a project results in demolition or material alteration in an adverse manner of those physical characteristics of a resource that:

- convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the CRHR;
- account for its inclusion in a local register of historical resources pursuant to PRC 5020.1(k) or its identification in a historical resources survey meeting the requirements of PRC 5024.1(g), unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
- convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by a lead agency for purposes of CEQA.

4.20.3 Effects and Mitigation Measures

4.20.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento Bypass Levee reach in the CHP Academy EIP project area. No levee improvements would be made to increase the level of protection. Under the No Action Alternative, it is presumed that no ground-disturbing activities associated with levee repair and alternatives would occur. Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento Bypass Levee could fail due to seepage or slope stability/geometry issues would continue. Failure of the Sacramento Bypass Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city. If the Sacramento Bypass Levee were to fail, a cultural resource could be in the path of an inundation of debris and mud from that failure that could cause significant damage to or the complete destruction of the resource. Furthermore, emergency efforts to stop and repair a failed levee potentially would cause the same or more significant effects than those described for the proposed EIP. While the levee would be damaged, the extent of potential damage to the resource is unknown. It is also unknown whether these events would transpire and affect other cultural resources and therefore further analysis of effects on cultural would be speculative. Federal agencies responsible for levee repairs would be responsible for compliance with Section 106, as would local governments responsible for carrying out Federal programs.

4.20.3.2 CHP Academy Applicant Preferred Alternative

Implementation of the CHP Academy APA would result in the following effects on cultural resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
CR-1: Effects on Architectural (Built Environment) Resources and Cultural Landscapes	Less than Significant	N/A	N/A
CR-2: Change in the Significance of an Archaeological Resource	Significant	Significant and unavoidable	CR-MM-1: Implement Inadvertent Discovery Procedures of the WSLIP Program Historic Properties Management Plan
CR-3: Disturbance of Native American and Historic-Period Human Remains	Significant	Significant and Unavoidable	CR-MM-2: Implement Human Remains Discovery Procedures of the WSLIP Program Historic Properties Management Plan

Effect CR-1: Effects on Architectural (Built Environment) Resources and Cultural Landscapes

The Sacramento Weir and Bypass are eligible for NRHP and CRHR listing and the Sacramento River Levee appears to meet NRHP and CRHR criteria. The Sacramento Weir and Sacramento Bypass are located adjacent to proposed construction. Therefore, WSAFCA is not expected to cause the physical destruction, relocation, or alteration of these resources. Overall, WSAFCA would also not demolish or substantially alter the physical characteristics of the Sacramento River Levee or cause a major change to its engineering design or overall setting. The Sacramento Weir and Bypass and the Sacramento River Levee would continue to convey their historical significance. Consequently, on the effect on these resources as a result of the proposed construction would be less than significant. No mitigation is necessary.

Effect CR-2: Change in the Significance of an Archaeological Resource

Although the project area has been surveyed and no archaeological resources were identified in the project area, there is the possibility that construction would unearth archaeological materials from beneath the ground surface. Damage to such resources, if they meet the significance criteria of the NRHP and/or the CRHR, would constitute a significant effect under CEQA (14 CCR 15064.5) and an adverse effect under Section 106 of the NHPA and NEPA. Therefore, the effect on archaeological resources would be significant. While implementation of Mitigation Measure CR-MM-1 (Implement Inadvertent Discovery Procedures of the WSLIP Program Historic Properties Management Plan) would reduce the intensity of the effect, the effect would still be significant and unavoidable.

Mitigation

Mitigation Measure CR-MM-1. Implement Inadvertent Discovery Procedures of the WSLIP Program Historic Properties Management Plan

In the event that archaeological resources are identified because of project-related ground disturbance, WSAFCA will implement the inadvertent discovery procedures of the WSLIP HPMP. The HPMP will direct the Corps and WSAFCA's cultural resources management activities in the WSLIP Program study area, including the CHP Academy EIP project area. The HPMP will describe the stop-work and consulting party communication protocols, a research design and methods for treatment of inadvertent archaeological discoveries, and reporting requirements. Implementation of the HPMP will ensure that any archaeological resources discovered during construction will be protected from additional damage or treated in such a manner that effects to the resources are

compensated through scientific excavation, analysis, reporting, and, as may be appropriate, public interpretation of the resources.

Effect CR-3: Disturbance of Native American and Historic-Period Human Remains

The project area is located in an area that is considered of moderate to high sensitivity for archaeological cultural remains, including burials. The potential for buried human remains to be unearthed and disturbed during ground-disturbing activities that would be associated with levee repair and alternative construction within the study area is considered high. The disturbance of any human remains is considered a significant effect. Implementation of the human remains discovery provisions in the program HPMP (Mitigation Measure CR-MM-2) would likely reduce the severity of this effect, but it would still be considered a significant and unavoidable effect.

Mitigation

Mitigation Measure CR-MM-2. Implement Human Remains Discovery Procedures of the WSLIP Program Historic Properties Management Plan

In the event that human remains are identified because of project-related ground disturbance, the WSAFCA will implement the human remains discovery procedures of the WSLIP Program HPMP. The HPMP will direct the Corps and WSAFCA's cultural resources management activities in the WSLIP Program study area, including the CHP Academy EIP project area. The HPMP will describe the stop-work and consulting party communication protocols, procedures for consulting with descendant communities, a research design, and methods for treatment of human remains discoveries, and reporting requirements. Implementation of the HPMP will ensure that any human remains discovered during construction will be protected from additional damage or treated in such a manner that effects to the resources are compensated through scientific excavation, analysis, reporting, and, as may be appropriate, public interpretation of the resources.

4.20.3.3 CHP Academy Alternative B

Implementation of the CHP Academy Alternative B would result in the following effects on cultural resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
CR-1: Effects on Architectural (Built Environment) Resources and Cultural Landscapes	Less than Significant	N/A	N/A
CR-2: Change in the Significance of an Archaeological Resource	Significant	Significant and unavoidable	CR-MM-1: Implement Inadvertent Discovery Procedures of the WSLIP Program Historic Properties Management Plan
CR-3: Disturbance of Native American and Historic-Period Human Remains	Significant	Significant and Unavoidable	CR-MM-2: Implement Human Remains Discovery Procedures of the WSLIP Program Historic Properties Management Plan

Effect CR-1: Effects on Architectural (Built Environment) Resources and Cultural Landscapes

This effect is the same as described above under the CHP Academy Applicant Preferred Alternative. Construction of the CHP Academy Alternative B is not expected to result in the physical destruction, relocation, or alteration of significant architectural resources. No mitigation is necessary.

Effect CR-2: Change in the Significance of an Archaeological Resource

This effect is the same as described above under the CHP Academy Applicant Preferred Alternative. There is a possibility that construction of the CHP Academy Alternative B would unearth archaeological materials from beneath the ground surface. Implementation of Mitigation Measure CR-MM-1 would reduce the intensity of this effect, but the effect would still be significant and unavoidable.

Mitigation

Mitigation Measure CR-MM-1. Implement Inadvertent Discovery Procedures of the WSLIP Program Historic Properties Management Plan

Effect CR-3: Disturbance of Native American and Historic-Period Human Remains

This effect is the same as described above under the CHP Academy Applicant Preferred Alternative. The disturbance of any human remains would be considered a significant effect. Implementation of Mitigation Measure CR-MM-2 would likely reduce the severity of this effect, but it would still be considered a significant and unavoidable effect.

Mitigation

Mitigation Measure CR-MM-2. Implement Human Remains Discovery Procedures of the WSLIP Program Historic Properties Management Plan

Chapter 5
The Rivers Early Implementation Project

5.1 Introduction

This chapter provides the project-level analysis for The Rivers EIP. The analysis of effects for The Rivers EIP tiers directly from the program analysis. To avoid repetition and for communication efficiency, background information that is general for the study area or common for all reaches or alternatives is summarized in this chapter and the reader is referred to Chapter 3 for further discussion. Site-specific setting and environmental consequence information is provided here to more fully explain the effect and the mitigation measures that would be implemented to reduce that effect. As stated in Chapter 3 for the WSLIP program-level analysis, the baseline environmental conditions used in this EIP analysis consist of the existing physical environment as of January 28, 2009, when WSAFCA published the Notice of Preparation (NOP) to prepare an EIR with the State Clearinghouse. USACE published a Notice of Intent (NOI) to prepare an EIS in the *Federal Register* on January 27, 2009.

Note: For readability, the pages in this chapter for the project-level analysis are numbered consecutively. The resource topics follow the same sequence as the Chapter 3 program analysis but the heading numbers vary based on the need for up-front text specific to the project-level analysis.

5.2 Purpose and Need

The purpose of implementing treatments at The Rivers site is to achieve a minimum of 200-year flood protection at the site (0.5% AEP), which would ultimately help reduce flood risk for the entire city of West Sacramento.

The approach to meet this purpose, as with the programmatic approach, is to provide an evaluation of The Rivers EIP site, develop alternatives for improvement, and provide a basis for partnerships with Federal and state agencies to implement improvements that meet the flood protection and compatible recreation and open space goals. The objectives under this purpose and approach are to:

- construct levee improvements as soon as possible to reduce flood risk as quickly as possible;
- construct improvements that are politically, socially, economically, and environmentally acceptable;
- provide recreation and open space elements for the city that are compatible with flood improvement actions; and
- ensure continuing Federal assistance for levee repairs and maintenance.

The general purpose of and need for action at The Rivers site are the same as described for the overall WSLIP in Chapter 1 (Section 1.4). Specific levee deficiencies at this site are geometry, stability, through-seepage, and under-seepage. Flood and recreation improvements implemented under The Rivers EIP would assist in incrementally achieving the purpose of and need for the WSLIP and would reduce local flood risk in the proximity of the project.

5.3 Alternatives

5.3.1 The Rivers Project Alternatives

5.3.1.1 Introduction

The Rivers EIP area is approximately 4,500 feet long and is located on the Sacramento River North Levee, just north of the confluence of the Sacramento and American Rivers, including part of The Rivers residential development (Figure 5-1). As stated above, levee deficiencies at this site include geometry, stability, through-seepage, and under-seepage.

Bryte Park/Riverbank Elementary School and The Rivers residential development are located south of The Rivers EIP. The DWR maintenance yard is located directly west of the site. A leaking underground storage tank for gasoline and diesel was discovered and removed from the DWR maintenance yard in 1994. Monitoring and sampling of groundwater and soil at and in the vicinity of the site of contamination began in September 2001 with the intent to explore the extent of the fuels-impacted groundwater and provide data on risk to sensitive receptors. A small portion of the plume is located within the footprint of western end of the project site (see Section 3.3, Water Quality and Groundwater Resources). DWR has created a work plan with the Regional Water Quality Control Board (RWQCB) to continue to monitor the site, which includes the installation of additional monitoring wells in 2009 and 2010. During flood improvement construction, WSAFCA would coordinate with DWR and RWQCB to ensure that construction does not conflict with the current remediation efforts.

5.3.1.2 The Rivers Alternatives Screening

WSAFCA considered a range of program alternatives that would address the deficiencies at The Rivers site. The improvement alternatives were narrowed as listed below.

- Alternative 1: slope flattening, slurry cutoff wall
- Alternative 2: slope flattening, seepage/stability berm
- Alternative 3: slope flattening, sheet pile wall

As introduced earlier in Section 2.2.2.3, WSAFCA established and applied nine criteria to qualitatively evaluate the alternative improvements and eliminate those alternatives that did not adequately meet the criteria. The criteria are re-listed below and detailed in Section 4.3.1.2, CHP Academy Alternatives Screening (the project objective is site-specific while the other criteria are the same).

- Meet the Project Objectives to Reduce Risk—The objective of the project is to alleviate through- and under-seepage concerns on this portion of the levee, as well as stability and geometry issues. Alternatives that provide the greatest reduction in subsurface water pressure (measured as the exit gradient of water moving through the soil) and improve slope stability and geometry relative to current levee standards are the most favored. Evidence of seepage (possible boils) has been observed at this site during previous high-water events.
- Availability of Funds
- Scalability of Construction

- Real Estate Requirements
- Land Use Compatibility
- Permit Requirements
- Environmental Constraints (such as biological and cultural resources)
- Integration of Multiple Objectives
- Evolving Technical Policy

In some cases, an alternative may partially meet a criterion while another meets it more fully. For this reason, the designations of more favorable (MF) and less favorable (LF) were applied to each criterion for each alternative. Table 5-1 below provides the results of the criteria evaluation.

Table 5-1. Evaluation of The Rivers EIP Alternatives

Permit Requirements	MF	LF	MF
Environmental Constraints	MF	LF	LF
Integration of Multiple Objectives	MF	LF	MF
Evolving Technical Policy	MF	MF	MF

Alternatives 1 and 3 appear to be the most favorable levee improvement strategies based on this evaluation of various potential levee repair alternatives for The Rivers site. Repairing this site through the installation of either form of seepage cutoff barrier requires the smallest temporary and permanent footprint for implementation. This reduced footprint will likely result in reduced real estate acquisition. The preliminary cost opinions developed for Alternative 1 and Alternative 3 identified similar costs to implement either (approximately $15million to $25 million). However, two factors distinguish Alternative 1 as the preferred strategy. First, a comparison of preliminary cost opinions developed for these alternatives identified Alternatives 1 and 3 as the least expensive to implement. Alternative 2 would require additional costs associated with real estate acquisition. Second, the noise and/or vibration associated with the installation of sheet pile panels in Alternative 3 may not be compatible with the close proximity of residences along a portion of this site. As a result, Alternative 1 is the proposed levee improvement strategy for The Rivers site.

Alternative 2 appears to be the least favorable alternative. This alternative requires the installation of a seepage and/or stability berm. In most cases, berms require some amount of additional real estate to implement. The acquisition of additional real estate often results in increased project costs as well as additional various potential environmental impacts. At this site, the installation of a

seepage/stability berm would likely affect several residences, roads, and school facilities. Therefore, this alternative has not been carried forward for further consideration.

Based on the screening process, two of the alternatives were developed for The Rivers EIP to be carried forward for study in the EIS/EIR. Table 5-2 provides detail for the levee stationing and treatments proposed for each alternative. The alternatives (in addition to no action) are identified below.

- **The Rivers APA.** The installation of a slurry cutoff wall combined with landside slope flattening (Alternative 1, above).
- **The Rivers Alternative B.** The installation of a sheet pile wall **c**ombined with landside slope flattening (Alternative 3, above).

The proposed recreation program improvements are the same for both The Rivers APA and The Rivers Alternative B. Chapter 5 of this EIS/EIR includes an analysis of the effects of The Rivers APA, The Rivers Alternative B, and the No Action Alternative. A detailed description of both alternatives and the recreation improvements follows the alternatives screening discussion below.

Table 5-2. The Rivers EIP Flood Improvement Alternatives

EIP	Station Ranges		Deficiencies	APA Levee Treatments	Alt B Levee Treatments
The Rivers (70+00 to 115+00)	70+00	115+00	Through-seepage, under-seepage, stability, geometry	Slurry cutoff wall and landside slope flattening	Deep sheet pile wall and landside slope flattening

Source: Nordvik pers. comm.

5.3.1.3 No Action Alternative

Under the No Action Alternative, no flood or recreation improvements would be implemented at The Rivers site, West Sacramento would remain at flood risk, USACE levee vegetation guidance would be complied with, and current flood O&M activities would continue. A more complete discussion of no action as it applies to the WSLIP and this EIS/EIR is described in Section 2.4, with relevant detail provided below for the project-level analysis. Refer to Section 2.4 for discussion about the definition of no action, possibility of future Federal or state action, relationship of flood map modernization to no action, and USACE levee vegetation policy relative to no action.

5.3.1.3.1 Consequences of Levee Failure

Assuming that no levee repair or strengthening would occur under the No Action Alternative means that the Sacramento River North levee would remain or become more susceptible to failure as a result of identified deficiencies of seepage, geometry, and slope instability. As stated previously, evidence of seepage has been present at this site during high-water events, including possible boils. These conditions could cause portions of the levee to fail, triggering widespread flooding, extensive damage to the city's existing residential, commercial, agricultural, and industrial structures, and potential loss of life and property. Extensive damage to utilities, roadways, major interstate transportation corridors, and other infrastructure systems would also likely occur.

The magnitude of the flood damage would depend upon the nature of the levee failure, severity of the storm, and river flows at the time of a potential levee failure. A failure of this levee would first flood the residential communities of Broderick and Bryte, and then spread west to the CHP Academy site, overland flow would inundate the commercial core of West Sacramento, and ultimately could inundate the Southport area. The elevations are higher in the north sector of the city, meaning the land surface generally falls from the north and east toward the south and west. Therefore, a breach at this location could flood the entire city as the north basin would fill followed by the south basin.

Flood depth maps prepared for West Sacramento indicate that under a 100-year flood event scenario, inundation levels would range from 1 foot to 10 feet in the north basin, with most in the range of 1 to 5 feet, about 20% from 5 to 10 feet, and less than 10% less than 1 foot. Figure 2-1 shows the ultimate estimated inundation depths for a 100-year flood event.

In 2006, two hypothetical levee failures were analyzed for West Sacramento utilizing 100-year water surface elevations and hydrology. This analysis was performed to assist the City in its flood emergency preparedness planning. One failure was located in the northern part of the city, on the Sacramento River North Levee, and these results are directly representative of The Rivers site (failure locations are shown in Figures 2-2 and 2-3). (Wood Rodgers 2006.)

The analysis indicates that a levee failure on the Sacramento River North Levee during a 100-year event would flood the entire north area with at least 1foot of water within 24 hours, at which point vehicular evacuation would become severely limited (a depth of 1 foot is regarded as impassable from the standpoint of vehicular traffic). Certain neighborhoods close to the levee failure would lose access to evacuation routes within three hours of levee failure. Figure 2-2 shows the estimated time to 1-foot inundation depths throughout the northern area. Within3 days, floodwater depths would reach 3to 10 feet, depending on land surface elevation (as shown in Figure 2-1). Floodwaters would flow from north to south, seeking the lowest topographical elevation, and eventually discharge into the DWSC. The study estimates that floodwaters would begin to spill into the DWSC less than 24 hours after the breach. Modeling indicates that the DWSC could absorb up to 20,000 cubic feet per second (cfs) in discharge flow from waters flooding the north area of the city before overtopping and flooding the Southport area. (Wood Rodgers 2006.)

Levee failure and subsequent flooding of the city of West Sacramento would affect the entire city, jeopardizing lives, and would cause substantial damage to structures, contents, and other property such as landscaping and automobiles. As of 2005, a population of 40,439 was living in 15,448 housing units within the city (Sacramento Area Council of Governments 2008a and 2008b). All of these residents could be displaced by a catastrophic flood event. Additionally, the city is home to 30,655 jobs (Sacramento Area Council of Governments 2008c), 734 commercial and industrial structures, 46 public structures and 27 park facilities, which would all be affected by a flood event (HDR 2009). Environmental and agricultural resources could also sustain major damage in a flood event; 22.6% of the land area within the city is either farmland or open space (City of West Sacramento 2009). If a catastrophic flood event occurred resulting in inundation up to 15 feet, land damages are estimated to be $237,763,648 and structural damages could be up to $1,750,118,102 (PB 2007). These values are based on the 100-year event.

A flood event could cause severe public health hazards as well. Flooding in the city could upset and spread stored hazardous materials, creating hazardous conditions for the public and the environment. Flood damage to homes and other structures could render them dangerous, due to structural damage as well as contamination. Additionally, the floodwaters and ponds left behind

could provide a wide breeding ground for mosquitoes and other disease vectors. Effects to the water supply system could be particularly severe in a flood event, and could leave residents and businesses without a reliable water supply for a significant amount of time, as a single break in a water delivery pipe or main could contaminate the entire city's water supply. A major flood event could also result in substantial stress or disruption to the region's emergency response capacity, hospital services, and other critical lifelines of West Sacramento.

During the recovery period after a flood event, West Sacramento residents would require temporary housing, and displacement of many or all occupants would occur while levees, buildings, and other infrastructure were repaired. Businesses, social services, and other employers occupying affected structures would be forced to relocate. The potential number of displaced residents (over 40,000) and businesses (over 30,000 jobs) is so large that the demand for temporary quarters would likely exceed the available supply of vacant buildings surrounding the West Sacramento area. Thus, many displaced residents and businesses may be forced to relocate to areas a considerable distance from West Sacramento, resulting in substantial intermediate-term and long-term economic impacts on the West Sacramento area and its people. These impacts include changes in employment numbers and patterns, business and personal incomes, tax revenues, and regional economic activity.

A flood event in West Sacramento would also disrupt state and interstate highway, rail, and shipping traffic, causing long-term effects on the region's and the state's economy and ability to move people and goods. West Sacramento has one of the most comprehensive transportation networks on the west coast. Its central geographic location and extensive north-south and east-west highway access has made it a major distribution center. High volumes of truck and passenger traffic pass through the city on Interstate 80 and US-50/Business 80 every day, with truck traffic transporting approximately $63 billion worth of cargo annually through West Sacramento (HDR Engineering 2009). Major transcontinental rail lines passing through the city provide commercial and passenger rail service to all parts of the nation, and the Port of West Sacramento runs domestic and international shipping services (City of West Sacramento 2009). Approximately 9.3 million tons of rail freight valued at approximately $5 billion travels through West Sacramento annually (HDR Engineering 2009). Flooding of this transportation and distribution infrastructure would cut off major statewide and interstate transportation corridors.

Examples of critical facilities for government and commerce in West Sacramento that would be affected by a flood event are the CHP Academy, regional distribution centers for the U.S. Postal Service and United Parcel Service, Raley Field, offices for the California Department of General Services and California State Teachers' Retirement System, the Port of West Sacramento, wastewater treatment facilities, Interstate 80, US 50, and numerous other government and commercial buildings and infrastructure.

5.3.1.4 The Rivers Flood Improvement Alternatives

5.3.1.4.1 The Rivers Applicant Preferred Alternative—Slurry Cutoff Wall and Landside Slope Flattening

The Rivers APA would be a combination of slurry cutoff wall and landside slope flattening, which would address through-seepage, under-seepage, stability, and geometry deficiencies. The staging area would be located on the levee at the western end of the project site. There are 11 residences located on top of the levee and 4 residences adjacent to the landside toe of the levee encroaching on

the levee operation and maintenance area. The treatments and phases of construction are described in more detail below.

Treatment

Slurry Cutoff Wall

A 3-foot-wide slurry cutoff wall would be constructed from station 70+00 to station 115+00 up to a depth of 135 feet below degrade elevation using the DSM method of construction (Figure 5-1). The DSM method uses a crane-supported set of two to four mixing augers (typically 36 inches in diameter) set side by side. These augers are drilled through the levee crown and foundation to the required depth (capable of a maximum depth of about 200 feet). As the augers are inserted and withdrawn, a cement-bentonite grout is injected through the augers and mixed with the native soil. An overlapping series of mixed columns is drilled to create a continuous slurry cutoff wall panel.

To provide a working platform on the levee crown with adequate width, 69,000 cubic yards of embankment fill material would be excavated and hauled from the project site and disposed of at a permitted site within 20 miles of the project site. An excavator would manipulate injector return spoils near the DSM rig, and transport trucks would be used to haul spoils to an appropriate disposal area. A crane would be used for in-place sampling of DSM material and also for loading bentonite into the batch plant hopper. A mobile batch plant (diesel-powered) is required near each DSM rig at the work area to prepare the cement-bentonite grout. The grout is transported to the DSM rig through flexible hoses. The batch plant would require a pad of 50 by 100 feet within the staging area. Hauling at the work area would include scraper runs along the levee to the staging area and cement and bentonite deliveries to the batch plant.

During DSM slurry wall construction, one DSM rig typically can construct 20 linear feet of DSM wall per day (for wall depths up to 120 feet).

Slope Flattening

The existing landside slope of the levee is steep and requires flattening to meet appropriate slope stability and levee geometry requirements. The waterside slope would be trimmed and reshaped to a 2.5:1 slope the full length of the site (pending USACE approval based on engineering analysis to support a slope steeper than 3:1). The landside toe would remain at the same point.

Construction Details

Demolition and Vegetation Removal

The first phase of construction would consist of road demolition and clearing, grubbing, and stripping the levee surface. The roadway on the levee crown, Rivercrest Drive, would be dismantled before starting levee degradation. Asphalt debris from road demolition work would be hauled off site to an appropriate disposal location.

Demolition and vegetation removal would be performed for levee improvement construction and to comply with USACE vegetation guidance and CVFPB encroachment regulations requiring a vegetation-free zone. Clearing activities would consist of removing the larger vegetation such as trees and shrubs. Grubbing activities would consist of removing roots and stripping activities would consist of excavating approximately a foot of organic material from the levee surface. Approximately 75 to 100 trees on the landside and waterside of the levee would be removed to comply with USACE

levee vegetation guidance. In addition, there are a number of trees located just north of the disturbance boundary near stations 83+00 to 85+00. If these trees are determined to be within the vegetation-free zone as defined by the USACE levee vegetation guidance, they would be removed. It has been determined that the remaining waterside trees outside the disturbance footprint are not within the theoretical levee prism or vegetation-free zone and are in compliance with the USACE levee vegetation guidance.

Levee Degradation

Along the entire length of levee (4,500 feet) approximately one-third (6 feet) of the levee crown would be degraded to provide a 60- to 80-foot working platform. Approximately 58,000 cubic yards would be degraded and hauled from the project site and disposed of at a permitted site within 20 miles of the project site. Following completion of the slurry cutoff wall and slope flattening construction, approximately 92,000cubic yards of suitable levee embankment fill material would be transported from a permitted source 10 miles away from the project site to restore the levee crown to its original elevation.

Materials Reuse and Importation

Materials imported to the project site would include water, bentonite, cement, incidental construction support materials, aggregate base rock, asphalt, hydroseed, and about 92,000 cubic yards of embankment fill material. Embankment fill material excavated to construct levee improvements would be evaluated to determine its suitability for reuse. Any of the embankment fill material deemed suitable for reuse would be used to rebuild the levee. Embankment fill material of poor quality would be hauled to a permitted disposal site. Following completion of the slurry cutoff wall and slope flattening construction, approximately 92,000 cubic yards of suitable levee embankment fill material would be transported from a permitted source 10 miles away from the project site to restore the levee crown to its original elevation.

Temporary Facilities and Access Provisions

To facilitate project construction, earthen ramps would be improved to allow equipment access between the levee crown and staging area. Access would be limited to construction traffic only. Temporary construction easements may be required to lawfully secure access to the areas affected by construction. Riverbank Road, Fountain Road, and a small length of River Crest Road would be closed during construction, up to the duration of the project as noted below under Construction Schedule. Road lane closures would be addressed in Chapter 5, The Rivers Early Implementation Project.

Protection of Biological Resources

WSAFCA representatives met with representatives of USFWS and CDFG at The Rivers EIP site in December 2009 to discuss acceptable measures for the protection of special status species. During this coordination meeting, measures to protect VELB and Swainson's hawk were agreed upon and are included as part of the Rivers EIP. Those measures include protective K-rail fencing and orange construction fencing (Figure 5-2). See the Wildlife section (5.12) for descriptions of land cover types where these species may exist and the potential effects of this project on these species. Protective measures that will be implemented as part of the Rivers EIP for each of the species are as follows:

Q:\PROJECTS\HDR\00875_07\MAPDOC\FENCING_EIR\EIR_FIG_5_2_RIVERS_FENCING.MXD SS (03-17-10)

Figure 5-2
The Rivers EIP
Protection Fencing Map

Valley Elderberry Longhorn Beetle

In the study area, elderberry shrubs occur in the Sacramento River riparian corridor adjacent to the project construction limit. Shrub survey results are shown in Wildlife, Section 5.12, Table 5.12-3, and Figure 5.12-1. A total of 22 shrubs or shrub clusters are located within 100 feet of the project construction limit.

The following measures will be implemented to avoid and minimize effects on VELB:

- Before ground disturbance, all construction personnel will participate in a USFWS-approved worker environmental awareness program. A qualified biologist approved by the USFWS will inform all construction personnel about the life history of VELB and the importance of its host shrub, the elderberry. Proof of this instruction will be submitted to the USFWS.
- Protective buffer areas will be created for elderberry shrub clusters by the installation of approximately 1500 feet of K-rail fencing along the edge of the construction zone (see Figure 5-2). In the eastern portion of the project area, there are shrubs that lie within existing tree canopy. To protect these shrubs and avoid potentially damaging existing trees, an approximate 80-foot semi-circle of orange construction fencing will be installed adjacent to the construction zone in this portion of the study area (See Figure 5-2). Within buffer areas, signs will be posted along fencing for the duration of construction. The signs will contain the following information:

  > This area is habitat of the valley elderberry longhorn beetle, a threatened species, and must not be disturbed. This species is protected by the Endangered Species Act of 1973, as amended. Violators are subject to prosecution, fines, and imprisonment.

- Buffer area fences around elderberry shrubs/clusters will be inspected weekly by a qualified biologist during ground-disturbing activities and monthly after ground-disturbing activities until project construction is complete or until the fences are removed, as approved by the biological monitor and the resident engineer. The biological monitor will be responsible for ensuring that the contractor maintains the buffer area fences around elderberry shrubs throughout construction. Biological inspection reports will be provided to the project lead and USFWS.
- WSAFCA will ensure that the project site will be watered down as necessary to prevent dust from becoming airborne and accumulating on elderberry shrubs in and adjacent to a project site.

Swainson's Hawk

Swainson's hawks are known to nest in and adjacent to the study area, and project construction within this reach could affect Swainson's hawk, either directly or through habitat modification.

To avoid and minimize effects on Swainson's hawk, the following measures will be implemented:

- If a nest is found to occur within or adjacent to the study area on the western side of the Sacramento River, before ground disturbance, all construction personnel will participate in a CDFG-approved worker environmental awareness program. A qualified biologist will inform all construction personnel about the life history of Swainson's hawk and the importance of nest sites and foraging habitat.
- A breeding season survey for nesting birds will be conducted for all trees and shrubs that will be removed or disturbed which are located within 500 feet (0.5 mile for Swainson's hawk) of construction activities, including grading. Swainson's hawk surveys will be completed during at

least two of the following survey periods: January 1 to March 20, March 20 to April 5, April 5 to April 20, and June 10 to July 30 with no fewer than three surveys completed in at least two survey periods, and with at least one of these surveys occurring immediately prior to project initiation (Swainson's Hawk Technical Advisory Committee 2000). Other migratory bird nest surveys can be conducted concurrent with Swainson's hawk surveys with at least one survey to be conducted no more than 48 hours from the initiation of project activities to confirm the absence of nesting. If the biologist determines that the area surveyed does not contain any active nests, construction activities, including removal or pruning of trees and shrubs, can commence without any further mitigation.

- If active nests are found, WSAFCA will maintain a 0.25-mile buffer between construction activities and the active nest(s). In addition, a qualified biologist will be present on-site during construction activities to ensure the buffer distance is adequate and the birds are not showing any signs of stress. If signs of stress that may cause nest abandonment are noted, construction activities will cease until a qualified biologist determines that fledglings have left an active nest.

Utility Modifications

There are several utilities within the levee prism, including water, electricity, telephone, gas, and sanitary sewer lines; a storm drain; and two utility holes. According to CVFPB requirements, utilities are not allowed within the official levee prism (defined by a 20-foot width along the crown and 3:1 slope ratio landside and waterside). The top portion of a levee that falls outside the official levee prism is called freeboard. Utilities are allowed to be placed within the freeboard portion of a levee. Currently, utilities exist within the levee prism and must be relocated. All of the existing utilities within The Rivers project area (including those outside the levee prism) may be relocated and would be temporarily out of service during relocation activities.

Road Reconstruction

After levee improvements are completed, road reconstruction would occur at Rivercrest Drive. An aggregate base course would be installed and compacted. Lastly, asphalt would be added and compacted.

Construction Schedule

The goal of the project is to complete The Rivers improvements in 2011. The project is expected to be completed within 147 days. All flood improvement construction and staging would take place during the typical construction season (April 15 to November 1). Table 5-3 shows the phases of construction, equipment requirement, duration, and estimated time of year for construction activities.

Constraints, which may include contract award delays due to permitting, early season rain, the presence of nesting raptors, and equipment shortages, have the potential to suspend the construction of the project before the start of the flood season (November 1) in 2011. The Rivers APA construction contract would allow the contractor to construct on a 24-hours-per-day/7-days-per-week (24/7) work schedule to complete the construction of the improvements before the flood season in order to manage the risk of delay due to the constraints described above. The construction schedule described in the section below lists both the standard 10-hour-per-day/ 5-days-per-week work schedule and the 24/7 condensed work schedule. Either of these schedules may be used for the project.

Table 5-3. The Rivers APA: Construction Schedule Options

Phases of flood improvement construction	Required Equipment	Standard Duration (Days)	24/7 Duration (Days)
Mobilization	N/A	4	1.7
Roadway demolition	Bulldozers, dump trucks, a loader, and an excavator	2	0.8
Clearing and grubbing	A bulldozer, dump trucks, and an excavator	6	2.5
Levee degrade	A bulldozer, dump trucks, and an excavator	27	11.25
Slope flattening	A bulldozer, dump trucks, and an excavator	7	3
Slurry wall construction	A bulldozer, a long reach track hoe, a loader, a dump truck, and a rough terrain forklift	21	8.75
DSM wall construction	A delivery truck, a crane with augers, a loader, and a rough terrain forklift	44	18.3
Fill placement	Bulldozers, dump trucks, an excavator, a compactor, a maintainer, and a water truck	31	0.3
Roadway reconstruction	Dump trucks, a skip loader, a blade, a sheepsfoot compactor, a distributor, an asphalt paver, a pneumatic compactor, and a roller compactor	2	0.8
Demobilization	N/A	3	1.25
Total Days:		**147**	**61.35**

Source: Nordvik pers. comm.

Residents within the Immediate Vicinity of Construction

There are approximately 15 residences within the immediate vicinity of construction activities. During some periods of time, construction activities would be directly adjacent to their homes. In addition, the proposed utility modifications would result in the temporary disruption of service (water, communications, electricity, gas, and sanitary sewer) during construction. Disruptions in service would be up to four hours per episode for electrical, communications, and gas and up to eight hours per episode for water and sanitary sewer. Access by auto and by foot will be maintained, subject to detour and periodic closure (less than four hours). WSAFCA would provide assistance for residents to relocate during construction activities and provide compensation to residents for reasonable rent and living expenses incurred due to relocation. In accordance with the Uniform Relocation Assistance and Real Property Acquisition Act, residents would be provided with decent, safe, and sanitary housing. In addition, WSAFCA would provide onsite security to ensure the protection of the resident's homes and contents during relocation.

Post-Construction Operation and Maintenance

After construction of slurry wall and slope flattening, the staging areas and levee slopes would be hydroseeded for erosion protection and to prevent colonization of exotic vegetation.

The only permanent facility would be the improved levee, subject to typical O&M as described under the CHP Academy APA above.

5.3.1.4.2 The Rivers Alternative B—Sheet Pile Wall and Landside Slope Flattening

The treatments proposed under Alternative B at The Rivers EIP consist of the installation of a deep sheet pile wall and landside slope flattening. A staging area of approximately 3.22 acres would be located in the northwestern corner of the project site. The treatments and phases of construction are described in more detail below.

Treatment

Sheet Pile Wall

A trench would be excavated along the sheet pile alignment to allow the pile to be driven to the proposed grade (below the existing levee grade). A driving template fabricated from structural steel would be placed to control the alignment as the sheet pile is installed. A hydraulic or pneumatically operated pile driving head attached to a crane would drive the sheet pile into the levee crown to the desired depth (up to 135 feet). An additional crane or excavator would be used to facilitate staging of the materials. The conditions of the site, driving pressure, hydrostatic loads, and corrosion considerations would determine the thickness and configuration of the sheet piles. If conditions indicate that corrosion is an issue the sheet piles can be coated, oversized to provide additional thickness as a corrosion allowance, and/or provided with a cathodic protection system.

Slope Flattening

The existing landside slope of the levee is steep and requires flattening to meet appropriate slope stability and levee geometry requirements. The waterside slope would be trimmed and reshaped to a 2.5:1 slope the full length of the site (pending USACE approval based on engineering analysis to support a slope steeper than 3:1). The landside toe would remain at the same point.

Construction Details

Demolition and Vegetation Pruning and Removal

The first phase of construction would consist of road demolition and clearing, grubbing, and stripping the levee surface. The roadway on the levee crown, Rivercrest Drive, would be dismantled before starting levee degradation. Asphalt debris from road demolition work would be hauled off site to an appropriate disposal location.

Demolition and vegetation removal would be performed for levee improvement construction and to comply with USACE vegetation guidance and CVFPB encroachment regulations requiring a vegetation-free zone. Clearing activities would consist of removing the larger vegetation like trees and shrubs. Grubbing activities would consist of removing roots and stripping activities would consist of excavating approximately a foot of organic material from the levee surface. Approximately 75 to 100 trees on the landside and waterside of the levee would be removed to comply with USACE levee vegetation guidance. There are a number of trees located just north of the disturbance boundary near stations 83+00 to 85+00. If these trees are determined to be within the vegetation free-zone as defined by the USACE levee vegetation guidance, they would be removed. It has been determined that the remaining waterside trees outside the disturbance footprint are not within the theoretical levee prism or vegetation-free zone and are therefore not proposed for removal. Approximately 11,000 cubic yards of material would be excavated and hauled off site to an appropriate disposal location during the clearing and grubbing phase of construction.

Materials Reuse and Importation

Materials imported to the project site would include water, cement, incidental construction support materials, aggregate base rock, asphalt, sheet pile walls, hydroseed, and about 55,000 cubic yards of new embankment fill material to replace poor quality levee material. Embankment fill material excavated to construct levee improvements would be evaluated to determine if it is suitable for reuse. Any of the embankment fill material deemed suitable for reuse would be used to rebuild the levee. Embankment fill material of poor quality would be hauled off site to a permitted disposal site.

Temporary Facilities and Access Provisions

To facilitate project construction, earthen ramps would be improved to allow equipment access between the levee crown and staging area. Temporary construction easements may be required to lawfully secure access to the areas affected by construction. Riverbank Road, Fountain Road, and a small length of River Crest Road would be closed during construction.

Utility Modifications

There are several utilities within the levee prism, including water, electricity, telephone, gas, and sanitary sewer lines; a storm drain; and two utility holes. According to CVFPB requirements, utilities are not allowed within the official level prism (defined by a 20-foot width along the crown and 3:1 slope ratio landside and waterside). The top portion of a levee that falls outside the official levee prism is called freeboard. Utilities are allowed to be placed within the freeboard portion of a levee. Currently, utilities are placed within the levee prism and must be relocated. All of the existing utilities within The Rivers project area may be relocated and would be temporarily out of service during relocation activities.

Road Reconstruction

After levee improvements are completed, road reconstruction would occur at Rivercrest Drive. An aggregate base course would be installed and compacted. Lastly, asphalt would be added and compacted within the new road alignment.

Construction Schedule

The goal of the project is to complete The Rivers EIP improvements in 2011. The project is expected to be completed within 57 days. All flood improvement construction and staging would take place during the typical construction season (April 15 to November 1). Table 5-4 shows specific durations and equipment required for each phase of construction.

Constraints, which may include contract award delays due to permitting, early season rain, the presence of nesting raptors, and equipment shortages, have the potential to suspend the construction of the project before the start of the flood season (November 1) in 2011. The Rivers Alternative B construction contract would allow the contractor to construct on a 24-hours-per-day/7-days-per-week (24/7) work schedule to complete the construction of the improvements before the flood season in order to manage the risk of delay due to the constraints described above. The construction schedule described in the section below lists both the standard 10-hour-per-day/ 5-days-per-week work schedule and the 24/7 condensed work schedule. Either of these schedules may be used for the project.

Table 5-4. The Rivers Alternative B: Construction Options

Phase of flood improvements construction	Required Equipment	Standard Duration (Days)	24/7 Duration (Days)
Mobilization	N/A	4	1.7
Roadway demolition	Dump trucks, loaders, bulldozers, and an excavator	2	0.8
Clearing and grubbing	A bulldozer, dump trucks, and an excavator	6	2.5
Slope flattening	A bulldozer, dump trucks, and an excavator	23	9.6
Sheet pile wall	A long bed truck, cranes, and an impact hammer	18	7.5
Roadway reconstruction	Dump trucks, skip loader, water truck, motor grader, sheepsfoot compactor, distributor, asphalt paver, pneumatic paver, and roller compactor	2	0.8

Residents within the Immediate Vicinity of Construction

There are approximately 30 to 40 residences in the vicinity of the construction area. During some periods of time, construction activities would be directly adjacent to their homes. In addition, the proposed utility modifications would result in the temporary disruption of service (water, communications, electricity, gas, and sanitary sewer) during construction. Disruptions in service would be up to four hours per episode for electrical, communications, and gas and up to eight hours per episode for water and sanitary sewer. Access by auto and by foot will be maintained, subject to detour and periodic closure (less than four hours). WSAFCA would provide assistance for residents to relocate during construction activities and provide compensation to residents for reasonable rent and living expenses incurred due to relocation. In accordance with the Uniform Relocation Assistance and Real Property Acquisition Act, residents would be provided with decent, safe, and sanitary housing. In addition, WSAFCA would provide onsite security to ensure the protection of the resident's homes and contents during relocation.

Post-Construction Operation and Maintenance

After construction of the sheet pile wall and slope flattening, the staging areas and levee slopes would be hydroseeded for erosion protection and to prevent colonization of exotic vegetation.

The only permanent facility would be the improved levee, subject to typical O&M as described under the CHP Academy APA above.

5.3.1.5 The Rivers Recreation Improvements

As stated earlier in this chapter, the trails would be designed in compliance with USACE and CVFPB standards. The recreation program improvements proposed at The Rivers EIP are listed below:

- a paved bicycle/pedestrian levee crown trail;

- landside levee embankment ramps adjacent to Todhunter Avenue and the DWR maintenance facility;
- a paved pedestrian trail meandering parallel to the levee crown trail, leading to one landing near the river;
- replacement of the locked gate crossing the levee crown at The Rivers project area with a V-chicane or other control accessible to bicyclists and pedestrians;
- a semi-circular paved landing;
- updated access controls along levee crown pathway (fencing, bollards, or turnstiles); and
- interpretive and safety signage.

The recreation improvements components are described in greater detail below.

5.3.1.5.1 Paved Bicycle Trail and Levee Embankment Ramps

- The alignment of the levee crown bicycle/pedestrian trail is proposed atop the existing aggregate base access road that is currently used for flood control maintenance and operations.
- The paved bicycle/pedestrian path would be a minimum of 12 feet wide with a 2-foot-wide compacted aggregate base shoulder on either side of the trail to match the grade. Asphalt within the paved section would be 2 to 8 inches thick with a 4- to 8-inch thick base.
- Ramp construction would involve grading to provide a smooth transition between the bike trail and the connecting trail or roadway, at a slope in compliance with the Americans with Disabilities Act (ADA) and implementing regulations.
- A retaining wall may be necessary and is proposed to maintain existing slope while accommodating the trail per ADA compliance near the western edge of the project. The wall would be modular pre-cast concrete block (i.e., gravity type) and vary in exposed height from 2 to 7 feet by 140 linear feet.

See Figure 5-3 for conceptual cross sections of the trail.

5.3.1.5.2 Paved Pedestrian Trail

- The paved pedestrian paths would be 6 feet wide with a 2-foot- wide compacted aggregate base shoulder on either side of the trail to match the grade. Asphalt within the paved section would be 2 to 8 inches thick with a 4- to 8-inch thick base.
- The design of recreation improvements would be such that there would be no direct effects on elderberry shrubs, all improvements would occur above the ordinary high water mark (OHWM), and no more than 0.5 acre of riparian vegetation would be affected during the improvement construction.

5.3.1.5.3 Access and Signage

- Permanent safety signs would be installed at select trail access points and at periodic intervals along the trails to inform users that the trail serves as a levee maintenance road and to instruct them to watch for patrolling vehicles. These signs would also inform users that portions of the trail are subject to flooding and that trail damage and related safety hazards could occur during

the flooding season. Two interpretive signs describing the geographic and biological significance of the site would be installed along the trail.

5.3.1.5.4 Semicircular Paved Landing

- A paved landing, semi-circular in shape with a 20-foot diameter, would be located on the western end of the site along the waterside berm. The landing would provide an open view of the river and act as the terminus of the paved pedestrian pathway. The landing would include manufactured benches and trash receptacles.

See Figure 5-4 for a detail of the landing.

5.3.1.5.5 Construction Details

Construction staging and parking would be limited to the same areas designed for flood program improvement staging. Construction of the bicycle/pedestrian trails would consist of compacting, paving, and striping the existing graded levee top. These effects are described in Chapter 5. Grasses and other native vegetation approved by USACE and CVFCB would be planted after project construction to stabilize soils and reduce runoff from temporary disturbance areas. All recreation improvement construction and staging that affects the performance and operation of the levee would take place during the typical construction season (April 15 to November 1). Recreation improvement construction is expected to be completed within 30 days.

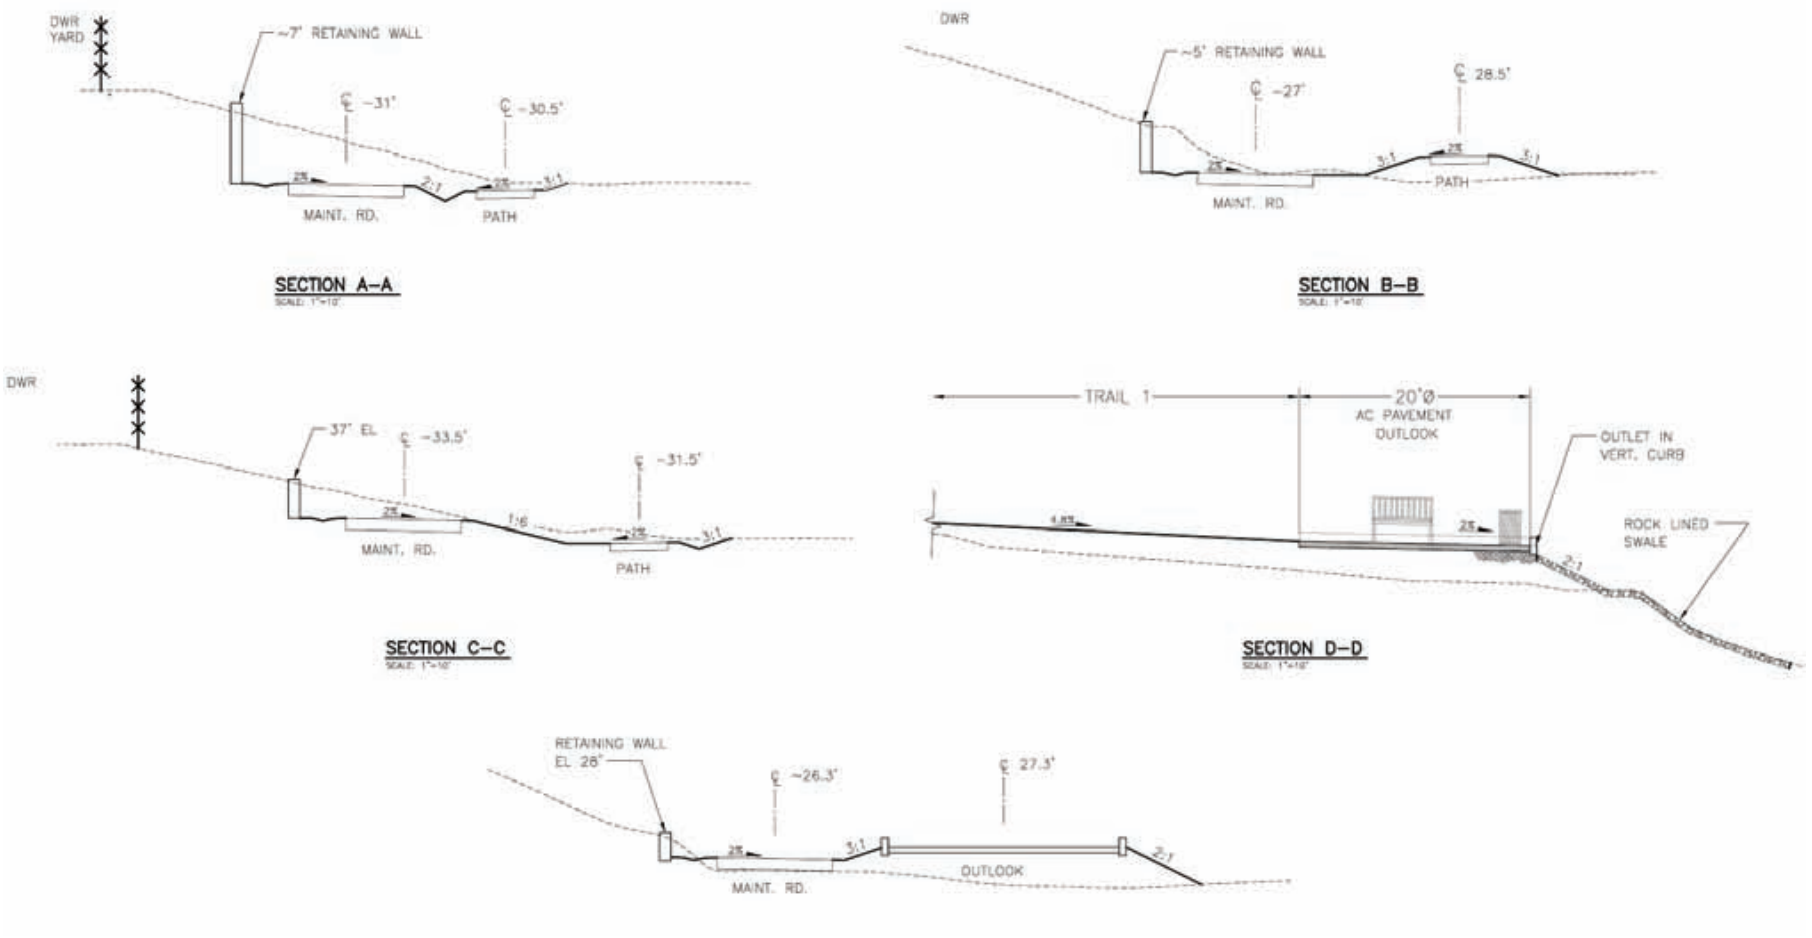

Table 5-5 lists phases of construction and types of construction equipment that may be used to construct the proposed recreation improvements.

Table 5-5. The Rivers EIP Recreation Improvements

Phase of recreation improvement construction	Required Equipment	Standard Duration (Days)
Mobilization	N/A	2
Clearing and pruning	Scraper, wheel loader, motor grader, dump truck, steel wheel loader, and water truck	5
Grading	Scraper, wheel loader, motor grader, dump truck, steel wheel loader, and water truck	8
Install pathways and landing	Dump truck, asphalt paver, asphalt sealer, striping truck, small front loader, skid steer loader and small roller	12
Install levee embankment ramp	Bulldozers, dump truck, compactor, maintainer, asphalt paver, asphalt sealer, striping truck, small front loader, skid steer loader and small roller	
Demobilization	N/A	3
Total Days:		**30**

5.3.1.5.6 Operation and Maintenance

The bikeway and all related facilities would be maintained by the City. The City would be responsible for checking trails and conducting trail repairs at the end of the flooding season and as

Figure 5-4
Paved Landing Details for The Rivers

needed. Maintenance of the bike trail would include sweeping, pavement repair, removal of obstacles, mowing and trimming, periodic asphalt overlays, and repair of associated facilities.

5.3.2 Environmental Commitments

As presented in Chapter 2, environmental commitments are measures incorporated as part of the project description, meaning they are proposed as elements of the proposed action and are to be considered in conducting the environmental analysis and determining effects and findings. To avoid and minimize construction-related effects, WSAFCA would implement the following environmental commitments at the program and project levels to reduce or offset short-term, construction-related effects. Measures have been developed for each of the topics below, to be applied in the program- and project-level resource analyses.

- Raptors
- USACE Levee Vegetation Guidance
- Protected Trees and Riparian Trees
- Avoid and Minimize the Spread or Introduction of Invasive Plant Species
- Stormwater Pollution Prevention Plan
- Temporary Visual Barriers between Construction Zones and Residences
- Noise-Reducing Construction Practices
- Temporary Resident Relocation, Property Acquisition, and Compensation for Loss of Business
- Traffic Control and Road Maintenance Plan
- Coordination to Ensure Minimal Overlap in Disturbance to Traffic during WSLIP Construction
- Notification of Construction Area Closure
- Minimization of Construction-Related Effects on Navigation
- Bentonite Slurry Spill Contingency Plan
- Spill Prevention, Control, and Counter-Measure Plan
- Implementation of Measures to Maintain Surface Water Quality and Groundwater Quality
- Monitoring of Turbidity in Adjacent Water Bodies
- Soil Supply Protection Measures

Section 5.4

Flood Control and Geomorphic Conditions—The Rivers Early Implementation Project

5.4.1 Affected Environment

This section describes the affected environment for hydrologic, hydraulic, geomorphic, and flood control issues in The Rivers EIP project area, including regulatory and environmental setting.

5.4.1.1 Regulatory Setting

5.4.1.1.1 Federal

The following Federal policies related to hydrologic, hydraulic, geomorphic, and flood control issues may apply to implementation of The Rivers EIP. Please see Section 3.2.3.3, Regulatory Setting, for a more complete description of each policy.

- National Flood Insurance Program
- U.S. Army Corps of Engineers Levee Design Criteria
- Executive Order 11988 (Floodplain Management)
- Section 401 of the Clean Water Act and State Regulations in Title 23 California Code of Regulations
- Code of Federal Regulations, Title 40, Part 131, Water Quality Standards
- Section 408
- Public Law 84-99 Delta Specific Standard

5.4.1.1.2 State

The following state policies related to hydrologic, hydraulic, geomorphic, and flood control issues may apply to implementation of The Rivers EIP. Please see Section 3.2.3.3, Regulatory Setting, for a more complete description of each policy.

- Central Valley Flood Protection Board
- Delta Protection Act of 1992
- Safe, Clean, Reliable Water Supply Act

5.4.1.1.3 Local

The following local policies and agencies related to hydrologic, hydraulic, geomorphic, and flood control issues may apply to implementation of The Rivers EIP. Please see Section 3.2.3.3, Regulatory Setting, for a more complete description of each policy.

- *Health and Safety Element of the Draft 2030 Countywide General Plan for Yolo County*

- *Health and Safety Section of the City of West Sacramento General Plan, Policy Document* (City of West Sacramento 1990)
- West Sacramento Area Flood Control Agency

5.4.1.2 Environmental Setting

This Rivers EIP project area is located on the west bank of the Sacramento River, just north of the confluence of the Sacramento and American Rivers. A portion of this reach runs adjacent to Riverbank Elementary School, and another portion intersects The Rivers Housing Development. The Rivers EIP Project area is approximately 4,500 feet long and is located on the Sacramento River North Levee. Levee deficiencies at this site are related to geometry, stability, and under-seepage. This section generally discusses the environmental setting related to hydrologic, hydraulic, geomorphic, and flood control issues in The Rivers EIP project area(Figure 3.2-1).For more detailed information about this resource, including climate, regional hydrology and geomorphic conditions, levee stability and levee height evaluations, see Section 3.2.2.2, Environmental Setting, of the program analysis.

5.4.1.2.1 Regional Hydrology

The Sacramento River drainage basin upstream of the American River confluence encompasses approximately 23,500 square miles. The monthly minimum, average, and maximum mean daily flows on the Sacramento River near Verona (upstream of the American River) and at Freeport (downstream of the American River) are presented in Table 5.4-1. The WSLIP program area extends down past the American River watershed. The Sacramento River at Freeport gage more closely reflects the actual project flow around the southern end of the WSLIP.

Table 5.4-1. Monthly Mean Daily Flow Statistics for Sacramento River at Verona and Sacramento River at Freeport for 1990 through 2008

	Sacramento River at Verona Station 11425500			Sacramento River at Freeport Station 11447650		
	Minimum	Average	Maximum	Minimum	Average	Maximum
January	6,460	29,888	95,600	6,560	34,311	113,000
February	6,200	34,008	76,300	6,030	39,647	94,100
March	7,730	31,811	80,700	8,300	36,793	99,500
April	3,920	22,552	73,600	4,340	26,786	91,800
May	3,870	19,199	69,600	4,640	23,511	88,600
June	3,590	16,028	60,500	6,120	19,810	70,500
July	3,830	15,051	28,400	7,030	18,434	44,500
August	4,890	14,582	22,800	7,230	16,669	26,400
September	7,350	13,525	24,700	8,150	15,188	28,600
October	4,820	9,449	18,900	5,100	11,065	23,600
November	5,230	10,239	30,700	5,530	11,912	34,800
December	5,600	19,452	73,700	6,250	22,289	96,400

Source: U.S. Geological Survey 2009. Available: <http://waterdata.usgs.gov/nwis/sw>.
Notes: Flow in cubic feet per second from January 1, 1990 to February 8, 2009.

All hydrologic information described below for the levee under investigation is derived and summarized from NHC (2007a).

Sacramento River Sites (Sacramento River North and South Levees—Reaches 1, 2, 7, and 8)

Daily streamflows have been recorded at the Sacramento River at Verona gage (gage 11425500) by the U.S. Geological Survey (USGS) since 1929. The gage is upstream of the proposed program area, at approximately RM 78.6. The Sacramento River at Sacramento (I Street) gage (gage 11447500) was operated by USGS from 1948 to 1979; it is now operated by DWR. The gage is located about 1,000 feet upstream of the I Street Bridge and about 0.5 mile downstream of the American River confluence at RM 59.5 in Reach 8. The Freeport gage (gage 11447650) is downstream of the proposed program area, at about RM 46. NHC (2007b) provides a detailed analysis of daily, seasonal, and peak flows at the I Street and Freeport gages.

Projected peak flows in the Sacramento and American Rivers were provided by MBK Engineers (2008a) based on the Sacramento and San Joaquin River basins California Comprehensive Study (Comprehensive Study) Sacramento River UNET model. In Table 5.4-2, the 100-year projected peak flow is based on a 145,000 American River peak flow and upstream Sacramento River levees overtopping without failing; the 200-year peak is based on 160,000 cubic feet per second (cfs) American River peak flow and the same levees overtopping without failing. See section on Flooding below for longitudinal profile information with resulting maximum water surface elevation profiles (for the 1/100 and 1/200 Annual Exceedance Probabilities [AEPs]), the approximate tops of the levees, and the original 1957 Flood Control Project design floodplain for the Sacramento River, Sacramento Bypass, Yolo Bypass, and DWSC.

Table 5.4-2. Projected Peak Flows for Sacramento River Sites

	Projected Peak Flow (cfs)	
Location	100-year[1]	200-year[2]
Sacramento River at Verona Gage	117,500	142,600
Sacramento River at I Street	135,600	143,300
Sacramento River at Freeport Gage	135,200	143,000
American River at H Street	145,000	160,000

Source: MBK Sacramento River UNET hydraulic model June 2008 simulations documented in *Supplemental Report for the City of West Sacramento Levee Alternatives Hydraulic Analysis - Draft*, August 6, 2008.

[1] Assumes levees overtop without failing; existing conditions and operations.

[2] Assumes levees overtop without failing; urban levees have three feet of freeboard on 1/200 AEP water surface; non-urban levees satisfy SRFCP design freeboard requirements; Folsom Dam Joint Federal Project in place.

5.4.1.2.2 Geomorphic Characteristics of the Study Area

The current geomorphology of The Rivers EIP project area is characteristic of Delta waterways. All waterways are bordered by levees. Channel alignments are preserved by ongoing levee maintenance and instream dredging. The Sacramento River in the vicinity of the project area is characterized by a low gradient and typical low-velocity flow and is composed almost entirely of deep, flat water with a

sand bed. River stage is controlled by dam and weir release upstream and is subject to diurnal tidal fluctuation. Very little sediment is stored in bars, and the bank-building process typical of lowland alluvial rivers no longer occurs. The channel width varies in the proposed project area but averages approximately 750 feet.

Levee and Bank Geometry

West Levee of the Sacramento River

The earliest maps along the Sacramento River, from 1908, show a levee on about the same alignment as at present, along the top of the west bank of the Sacramento River. This levee has been raised, widened, upgraded, and set back at some sites over the years. The Sacramento River South Levee crest is now between 17 and 23 feet high above the landslide toe, with crown elevations between 34 and 40 feet. South River Road lies along most of the levee crest, and crest widths are usually just larger than the minimum of 20 feet. Kleinfelder (2007) discusses the stability berms, drains, and other remediation measures constructed along this levee reach.

Kleinfelder (2007) also describes the levee soils and underlying foundation materials based on borings. The levee soils are typically silty sand and poorly graded clean sand. Beneath the levee materials, the typical profile consisted of a layer of fine-grained silt or clay (interpreted to be overbank deposits) underlain by up to 100 feet of sand and gravel, with interbedded silty sand and clayey sand layers. The main exception to the above typical profile is near the downstream end of the South Levee reach, where the levee is on an old railway grade. Drilling here showed a blanket of silt and clay extending at least 20 feet below the levee materials underlain by sand and/or gravel. These were interpreted to be floodbasin deposits, which appear to extend into the stream bank, overlying alluvium. The bottom of the flood basin deposits is at or above the thalweg elevation of the Sacramento River. The presence of these less-erodible deposits is thought to explain the straight, stable bank and narrow river section through the Clay Bend just near the downstream end of the South Levee reach.

Crest elevations along the Sacramento River North Levee (Reaches 8, 2, and 7) range from 34 to 44 feet NGVD 29 (Figure 3.2-4). Reach 8, the most downstream section of the Sacramento River North Levee, includes high ground that extends from the Barge Canal upstream to the Tower Bridge. The high ground is as high, or higher, than adjacent levee crests and extends at least 300 feet landward (Jones & Stokes 2006). The high ground appears to be stable and generally consists of river dredge spoils placed more than 75 years ago. Bank erosion was observed along this part of Reach 8, but it is not a concern for levee failure as the high ground functions as a very wide levee. From the Tower Bridge toward the I Street Bridge, the levee has been set back and protected as part of the River Walk project. However, the upstream 2,000 feet of Reach 8—near the I Street Bridge—has a minimum crest width and sparse bank protection and is close to the river. The erosion sites in Reach 8 are in this section of the Sacramento River North Levee.

In the middle of the Sacramento River North Levee (Reach 2), bank erosion was observed primarily where the levee crest appears to be extremely wide or where there is a substantial berm to protect the levee. From the upstream end of Reach 2, downstream for about 4,000 feet, revetment of varying size and age has been placed on the bank and levee. This revetment is often extremely steep and does not appear to meet current sizing criteria. For the next 4,000 feet, Reach 2 has some erosion protection. The patches of existing revetment do not appear to be engineered; however, the

materials on the bank are often reasonably large and the revetment appears to provide adequate protection against erosion.

The upstream end of the Sacramento River North Levee (Reach 7) includes both riprap-protected banks and wide levee crests. Downstream from the Sacramento Weir for about 7,000 feet, stream banks are generally steep; however, most are either adequately protected with riprap or the levee crest is wide. (This section includes USACE Emergency Levee Repair project at site 62.5R). At the downstream end of Reach 7, and extending for about 3,000 feet, a private contractor designed and built bank protection in the summer of 2006.

5.4.1.2.3 Levee Deficiency Analysis

Section 4 of HDR (2008a) includes the geotechnical assessment of the existing levees with regard to seepage, slope stability, and seismic vulnerabilities[1]. The information provided in HDR (2008a) is derived from two reports: *West Sacramento Levee System Problem Identification and Alternative Analysis: Volume 1—Geotechnical Problem Identification Solano and Yolo Counties, California* (Kleinfelder 2007), and *Phase 1 Geotechnical Evaluation Report (P1GER) West Sacramento* Region (URS 2007).

Data collection included 323 borings drilled with standard penetration tests and soundings made using cone penetration test equipment along the levees within the basin. Approximate stationing endpoints have been determined by URS (2007) and Kleinfelder (2007) based on similar soil characteristics within the endpoints. Deficiencies identified within the approximate stationing endpoints do not indicate the entire stretch of levee contains said deficiency; rather, a deficiency has been identified within the endpoints (HDR 2008a).

Levee Seepage Analysis

Engineering analysis evaluating levee seepage along the Sacramento River North Levee has been performed by URS (2007), and the findings were presented in their report titled *Phase 1 Geotechnical Evaluation Report (P1GER) West Sacramento Region* (URS 2007). URS (2007) performed their seepage analysis using water surface elevations that are different from the water surface elevations used in this chapter as determined by MBK Engineers (2007) and assumed a no-flow boundary at the center of the river (HDR 2008a).

Table 5.4-3 shows the seepage summary of the Sacramento River North Levee as completed by URS (2007). Exit gradients of 0.5 or greater for under-seepage require mitigation according to the USACE, and areas where through-seepage has been observed or projected based on soil conditions require mitigation.

Kleinfelder (2007) performed the engineering analysis evaluating levee seepage along the Sacramento River North Levee and presented their findings in a report titled *West Sacramento Levee System Problem Identification and Alternative Analysis: Volume 1—Geotechnical Problem Identification Solano and Yolo Counties, California* (Kleinfelder 2007). Kleinfelder performed their analysis using the water surface elevations determined by MBK Engineers (2007) and assumed a total head boundary at the center of the river.

[1] Seismic vulnerabilities are discussed in Chapter 6, Geology, Seismicity, Soils, and Mineral Resources.

The seepage summaries for the Sacramento River North Levee as completed by Kleinfelder (2007) are shown in Table 5.4-4. Exit gradients of 0.5 or greater for under-seepage require mitigation according to USACE, and areas where through-seepage has been observed or projected based on soil conditions require mitigation.

In brief, the Sacramento River North Levee has a significant amount of under-seepage, whereas the other reaches have much less extensive under-seepage problems. See Table 3.2-11 and Figure 4 of HDR (2008b) for additional information.

Levee Slope Stability Assessment

URS (2007) completed an engineering evaluation of levee slope stability and the effect of rapid drawdown for the Sacramento River North Levee and presented their findings in the report titled *Phase 1 Geotechnical Evaluation Report (P1GER) West Sacramento Region* (URS 2007). As with the levee seepage analysis described above, URS (2007) used water surface elevations that are different from the water surface elevations determined by MBK Engineers (2007) in their analysis of slope stability[2]. Rapid drawdown calculations have been completed only for the 100-year event as recommended to URS by their Independent Consulting Board (HDR 2008a).

The slope stability results as completed by URS (2007) for the Sacramento River North Levee are shown in Table 5.4-5.

Kleinfelder (2007) performed the engineering analysis evaluating levee slope stability and the effect of rapid drawdown along the Sacramento River North Levee and presented their findings in a report titled *West Sacramento Levee System Problem Identification and Alternative Analysis: Volume 1—Geotechnical Problem Identification Solano and Yolo Counties, California* (Kleinfelder 2007). Kleinfelder (2007) performed their analysis using the water surface elevations determined by MBK Engineers (2007).

The slope stability findings for the Sacramento River North Levee as completed by Kleinfelder (2007) are also shown in Table 5.4-5.

In brief, the Sacramento River North Levee has significant steady state stability deficiencies. The other reaches have less or none. See Table 3.2-11 and Figure 5 of HDR (2008b) for additional information.

Table 5.4-5. Slope Stability Summary

	Steady State		Rapid Drawdown	
Approximate Stationing	100-Year Event	200-Year Event	100-Year Event	200-Year Event

[2] Sections of the northern reaches have not been completed to date by URS; these sections will be completed in their final report projected to be issued at a later time.

Levee Geometry Evaluation

To evaluate the crown width and side slopes of the levees in the proposed program area, HDR (2008a) generated topography data by means of Light Detection and Ranging (LIDAR) using the North American Vertical Datum of 1988 (NAVD88).

In brief, most of the levees in the proposed program area, including The Rivers project area, have a geometry deficiency, and it is typically an over-steepened waterside slope that is the primary problem (HDR 2008b).

USACE requires that levees have a maximum steepness of 3:1 (H:V) waterside slopes and 3:1 (H:V) landside slope. The design criterion for the WSLIP conforms with these requirements, unless site-specific conditions permit otherwise (and USACE approval is granted based on engineering analysis to support a slope steeper than 3:1). Crown widths for primary levees are to be a minimum of 20 feet. For The Rivers EIP, it is proposed that the waterside slope would be trimmed and reshaped to a 2.5:1 slope the full length of the site (pending USACE approval). Refer to Appendix B in HDR (2008a) for tables identifying sections of the levees that do not meet the design criterion. Appendix D in HDR (2008a) contains LIDAR cross sections that have been used to evaluate levee geometry. Also refer to Figure 9 of HDR (2008b), which shows the approximate locations where a geometry deficiency has been identified.

Erosion Evaluation

An inventory of current bank erosion sites has been performed to identify sections of the levee that might incur future stability or seepage problems because of bank erosion. The erosion sites have been identified by visual inspection of the entire proposed program area. Table 3.2-11 and Figure 7 of HDR (2008b) summarize the results of the erosion evaluation. The sites have been prioritized based on significance of repairs needed to meet FEMA certification. The Sacramento River North Levee has three high priority sites totaling more than 1,100 feet. With the exception of one other long reach along the Yolo Bypass, there were no other high priority sites located in the northern West Sacramento basin (HDR 2008b).

For a complete summary of levee deficiencies, refer to Chapter 1, Introduction.

5.4.1.2.4 Flooding

Levees along the Sacramento River and other waterways provide flood control for the city of West Sacramento and conveyance for waters from upstream to the Delta. High winter flows can stress levees and berms. Longer flood durations can contribute to levee seepage and potentially structural levee failure. Flood water surface elevations can exceed levee heights and cause overtopping and partially controlled flooding of the protected areas behind the levee. Overtopped levees may maintain structural integrity and would not be considered failed levees. However, the erosive forces that occur during overtopping eventually may cause a structural failure and uncontrolled flooding in the protected areas behind the levee. To maintain the integrity of the flood control system, locations with the potential for failure have been and are being identified and remedied.

MBK Engineers (2007, 2008a, and 2008b) has developed water surface profiles for use in this analysis. Their reports describe and present the results of a hydraulic analysis that was made to determine 1/100 and 1/200 AEP (commonly referred to as 100-year and 200-year) water surface elevations in the surrounding waterways, as well as the potential worst case flood depth for the

South Cross Levee. The MBK version of the Comprehensive Study Sacramento River UNET model adopted for the Natomas Levee Improvement Program was used for this analysis. This adopted version is capable of modeling anticipated levee breaks or of allowing levee overtopping without failures. UNET is a one-dimensional unsteady open-channel flow model with the ability to simulate exchange of flow over levees with storage areas. The MBK UNET model results were a maximum composite of simulations made using hydrologic data for two storm centering scenarios: Sacramento River at latitude of Sacramento and Feather River at Shanghai Bend. In addition, the American River peak flow in the 100-year flood was 145,000 cfs, the current FEMA condition and in the 200-year flood was 160,000 cfs, the expected future peak flow.

The resulting maximum water surface elevation profiles (for the 1/100 and 1/200 AEPs), the approximate tops of the levees, and the original 1957 Flood Control Project design floodplain for the Sacramento River and Sacramento Bypass are provided in Figures 3.2-4 through 3.2-7 and Table 3.2-13 of the program section.

The MBK UNET model indicates no levee overtopping will occur along the Sacramento River or the Sacramento Bypass for the 100-year or the 200-year design floodflows. Nonetheless, levee height design criteria are not met for the Sacramento River North Levee. More information is provided in MBK Engineers' *Hydraulics Report for the City of West Sacramento Levee Alternatives Analysis* (2007) and Northwest Hydraulic Consultants' *West Sacramento Levees System: Problem Identification Report, Erosion Assessment and Treatment Alternatives, Draft for Review* (2007a).

Refer to the program section for a description of flood elevations and levee height evaluation by reach and for a complete description of modeling of hydraulic effects.

5.4.1.2.5 Past Sea-Level Rise in the Program Area

MBK Engineers (2009b) applied the USACE sea-level rise guidance (U.S. Army Corps of Engineers 2009b) to the WSLIP in order to determine the effects of potential sea-level rise on the program area. Since the WSLIP sea-level rise analysis is in support of the pre-existing project design, many of the points in the USACE policy guidance do not apply, particularly those that refer to the comparison of project alternatives. The MBK Engineers (2009b) report uses the procedure for calculating sea-level rise that is identified in the USACE guidance, and applies that procedure to the proposed WSLIP design.

Analysis of Historic Mean Sea Level Change

As described in the MBK Engineers (2009b) report, the nearest tide station with sufficient period of record (40+ years recommended) is the NOAA station 9414290 at San Francisco, CA. Tidal records for this station have been maintained back to the 1850s.

The NOAA Center for Operational Oceanographic Products and Services (CO-OPS) has analyzed the historic mean sea level for this site has been shown to be increasing at a rate of 2.01mm/yr (California Climate Change Center 2009 as cited in MBK Engineers 2009b).

Projections of future mean sea level change are discussed in the program section.

5.4.2 Environmental Consequences

This section describes the environmental consequences relating to hydrologic, hydraulic, geomorphic, and flood control issues for The Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects tier from the program analysis effects described in Section 3.2.3.3, Effects and Mitigation Measures.

5.4.2.1 Assessment Methods

The assessment methods used to determine effects on hydrology, hydraulics, geomorphology, and flood control issues resulting from The Rivers EIP include a review of the MBK Engineers (2005) hydraulic analysis of the effects of potential cumulative development in the Sacramento River corridor floodway between Verona and Courtland on flood stages and flows, and on professional judgment.

5.4.2.2 Determination of Effects

The criteria used for determining the significance of an effect on hydrology, hydraulics, geomorphology, and flood control are based on NEPA standards, Appendix G of the State CEQA Guidelines (Environmental Checklist) and standards of professional practice.

Effects on hydrologic or geomorphic conditions may be considered significant if implementation of an alternative would:

- substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on or off site;
- substantially alter the existing drainage pattern of the site or area, including the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on or off site;
- place within a 100-year flood hazard area structures that would impede or redirect floodflows; or
- expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.

Effects on flood control may be considered significant if implementation of an alternative would:

- significantly raise flood stage elevations;
- increase the frequency and duration of inundation of lands; or
- expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee.

An effect on the levee system is considered significant if an alternative would substantially increase any of the following:

- seepage,
- levee settlement,

- wind erosion,
- bank erosion or bed scour,
- sediment deposition, or
- subsidence of land adjacent to levees.

In addition, an effect on the levee system is considered significant if an alternative would substantially decrease any of the following:

- levee stability;
- inspection, maintenance, or repair capabilities;
- current level of levee slope protection;
- emergency response capabilities;
- channel conveyance capacity; or
- the ability of the levees to withstand seismic forces.

5.4.3 Effects and Mitigation Measures

Effects related to mean sea level change are only addressed in the No Action Alternative in the program section because the WSLIP program area is relatively insensitive to the rates of sea-level rise. Of all the scenarios analyzed, only the high sea-level rise rate 100 years after the project is constructed shows greater than one-tenth of a foot stage increase in the Sacramento River, Yolo Bypass, or Sacramento Bypass in the WSLIP program area.

5.4.3.1 No Action Alternative

The No Action Alternative represents the continuation of the existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. Current levee operations and maintenance activities would continue, but there would be no change in the geomorphic and flood control regimes relative to existing conditions.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to seepage or slope stability or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the magnitude described in the Flood Control and Geomorphic Conditions program analysis (Section 3.2.3.3.1). In summary, those effects could include excessive saturation and weakening of all of the city's levees, reducing levee integrity and resulting in an even greater risk of levee collapse, failure and further flooding and damage. Additionally, proposed levee strengthening projects in upstream areas may transfer flood risk to the study area if the Sacramento River North Levee remains below current engineering standards while other upstream levees are improved to meet or exceed current standards. However, given the uncertainty of the occurrence or magnitude of such an event, potential effects on geomorphic and flood control conditions cannot be quantified based on available information. Compliance with future vegetation policy enforcement on the Sacramento River North Levee would not have any noteworthy effects on the geomorphic and/or flood control regimes of the Sacramento River North Levee.

5.4.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on hydrologic, hydraulic, geomorphic, and flood control issues. A description of the effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
FC-3: Alteration of the Existing Drainage Pattern of the Site or Area	Significant	Less than significant	FC-MM-1: Coordinate with Owners and Operators, Prepare Drainage Studies as Needed, and Remediate Effects through Project Design
FC-6: Decrease in Through- and Under-Seepage	Beneficial	N/A	N/A
FC-7: Transfer of Seepage to Upstream or Downstream Levees	Less than significant	N/A	N/A
FC-8: Increase in Levee Slope Stability	Beneficial	N/A	N/A

Effect FC-3: Alteration of the Existing Drainage Pattern of the Site or Area

Implementation of slope flattening will involve earthwork on the landward side of the levee. The new material on the landside could alter surface runoff patterns. Because interference with drainage could cause or exacerbate local flooding, this effect may be significant. The implementation of Mitigation Measure FC-FC-MM-1 would reduce this effect to less than significant.

Mitigation

Mitigation Measure FC-MM-1: Coordinate with Owners and Operators, Prepare Drainage Studies as Needed, and Remediate Effects through Project Design

WSAFCA and their primary contractors for engineering design and construction will ensure that the following measures are implemented to avoid significant effects associated with disruption of local drainage systems.

During project design, project engineers will coordinate with owners and operators of local drainage systems and landowners served by the systems to evaluate pre- and post-WSLIP drainage needs and design features to remediate any project-related substantial drainage disruption or alteration in runoff that would increase the potential for local flooding. If substantial alteration of runoff patterns or disruption of a local drainage system could result from a project feature, a drainage study will be prepared as part of project design. The study will consider the design flows of any existing facilities that would be crossed by project features and develop appropriate plans for relocation or other modification of these facilities and construction of new facilities, as needed, to ensure equivalent functioning of the system during and after construction. If no drainage facilities (e.g., ditches, canals) would be affected, but project features would have a substantial significant effect on runoff amounts and/or patterns, new drainage systems will be included in the design of project alternatives to ensure that the project would not result in new or increased local flooding. Any necessary features to remediate project-induced drainage problems will be constructed before the project is completed or as part of the project, depending on site-specific conditions.

Effect FC-6: Decrease in Through and Under-Seepage

Through- and under-seepage has the potential to weaken levee foundations. The implementation of a slurry cutoff wall would reduce or eliminate the potential for seepage. Slurry cutoff walls create walls of impermeable material that act as a barrier to water moving laterally through a levee, greatly reducing or eliminating the potential for through-seepage. Implementation of a slurry wall would result in beneficial effects on flood conditions in the study area.

Effect FC-7: Transfer of Seepage to Upstream or Downstream Levees

Installation of a DSM cutoff wall at The Rivers project area may have a slight effect on the potential for seepage to occur through levee sections immediately upstream or downstream, as a result of redirection of hydraulic force.

However, the change in hydrologic conditions resulting from this treatment is not expected to result in a substantial increase in seepage through or under adjacent levees because any upstream or downstream levee will be engineered appropriately to an equal level of protection. Incremental improvements to the system will be made over a period of years and these improvements would reduce or eliminate any seepage problems.

Effect FC-8: Increase in Levee Slope Stability

The proposed slope flattening will repair and reshape slopes that are too steep and do not meet current standards. This would result in an increase in levee slope stability and a beneficial effect for geomorphic and flood conditions.

5.4.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on hydrologic, hydraulic, geomorphic, and flood control issues. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
FC-3: Alteration of the Existing Drainage Pattern of the Site or Area	Significant	Less than significant	FC-MM-1: Coordinate with Owners and Operators, Prepare Drainage Studies as Needed, and Remediate Effects through Project Design
FC-6: Decrease in Through- and Under-Seepage	Beneficial	N/A	N/A
FC-7: Transfer of Seepage to Upstream or Downstream Levees	Less than significant	N/A	N/A
FC-8: Increase in Levee Slope Stability	Beneficial	N/A	N/A

Effect FC-3: Alteration of the Existing Drainage Pattern of the Site or Area

Implementation of slope flattening will involve earthwork on the landward side of the levee. The new material on the landside could alter surface runoff patterns. Because interference with drainage could cause or exacerbate local flooding, this effect may be significant. The implementation of

Mitigation Measure FC-FC-MM-1, as described above under Rivers APA would reduce this effect to less than significant.

Effect FC-6: Decrease in Through and Under-Seepage

Through- and under-seepage has the potential to weaken levee foundations. The implementation of a slurry cutoff wall would reduce or eliminate the potential for seepage. Slurry cutoff walls create walls of impermeable material that act as a barrier to water moving laterally through a levee, greatly reducing or eliminating the potential for through-seepage. Implementation of a slurry wall would result in beneficial effects on flood conditions in the study area.

Effect FC-7: Transfer of Seepage to Upstream or Downstream Levees

Installation of a deep sheet pile wall at The Rivers project area may have a slight effect on the potential for seepage to occur through levee sections immediately upstream or downstream, as a result of the redirection of hydraulic force.

However, the change in hydrologic conditions resulting from this treatment is not expected to result in a substantial increase in seepage through or under adjacent levees because any upstream or downstream levee will be engineered appropriately to an equal level of protection. Incremental improvements to the system will be made over a period of years and these improvements would reduce or eliminate any seepage problems.

Effect FC-8: Increase in Levee Slope Stability

The proposed slope flattening will repair and reshape slopes that are too steep and do not meet current standards. This would result in an increase in levee slope stability and a beneficial effect for geomorphic and flood conditions.

Section 5.5

Water Quality and Groundwater Resources—The Rivers Early Implementation Project

5.5.1 Affected Environment

This section described the affected environment for water quality and groundwater resources in The Rivers EIP project area, including the regulatory and environmental settings.

5.5.1.1 Regulatory Setting

5.5.1.1.1 Federal

The following Federal regulations related to water quality and groundwater resources may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.3.2.1, Regulatory Setting, for a more complete discussion.

- Clean Water Act
- Section 404: Permits for Fill Placement in Waters and Wetlands
- Section 402: Permits for Discharge to Surface Waters
- Section401: Water Quality Certification
- Section 303: Impaired Waters

5.5.1.1.2 State

The following policies or agencies related to water quality and groundwater resources may apply to the implementation of The Rivers EIP. Please see Section 3.3.2.1, Regulatory Setting, for a more complete discussion.

- Porter-Cologne Water Quality Control Act
- Central Valley Regional Water Quality Control Board
- Basin Plans and Water Quality Objectives
- Water Quality Objectives by Region
- State Implementation Plan

5.5.1.1.3 Local

The following local regulations or agencies related to water quality and groundwater may apply to the implementation of The Rivers EIP. Please see Section 3.3.2.1, Regulatory Setting, for a more complete discussion.

- *City of West Sacramento General Plan*
- *Yolo County General Plan*

- *Solano County General Plan*

5.5.1.2 Environmental Setting

The following considerations are relevant to surface water quality and groundwater resources in The Rivers EIP project area. Existing surface water quality and groundwater quality are summarized below and more fully described in Section 3.32.2, Environmental Setting.

5.5.1.2.1 Surface Water Quality

The water quality of the Sacramento River is good to excellent, with relatively cool water temperatures, low BOD, medium to high DO, and low mineral and nutrient content. In general, the surface water quality of the Sacramento River is representative of agricultural return flows, urban runoff, and natural sedimentation from scouring. Water quality issues of concern within the Sacramento River include TSS and turbidity, DO, temperature, electrical conductivity, and pH. The Sacramento Bypass diverts Sacramento River flood flows around the city of West Sacramento.

5.5.1.2.2 Groundwater Quality

Groundwater levels in the Yolo Sub-basin are affected by drought, pumping, and reduced surface water discharge. Groundwater quality is considered good for agricultural and municipal purposes, although the water is hard.

5.5.2 Environmental Consequences

This section describes the environmental consequences relating to surface water and groundwater quality for The Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in table format. These effects tier from the program analysis effects described in Section 3.3.3.3, Effects and Mitigation Measures.

5.5.2.1 Assessment Methods

This evaluation of surface water quality and groundwater quality is based on professional standards and information obtained from the Central Valley RWQCB, State Water Board, and DWR.

The key effects were identified and evaluated based on the physical characteristics of The Rivers EIP project area and the magnitude, intensity, and duration of activities related to the construction of this project.

5.5.2.2 Determination of Effects

For this analysis, an effect pertaining to surface water quality and groundwater quality was considered analyzed under CEQA and NEPA if it would result in any of the following environmental effects, which are based on professional practice and State CEQA Guidelines Appendix G (14 CCR 15000 *et seq.):*

- violate water quality standards or waste discharge requirements;

- substantially deplete groundwater supplies or interfere substantially with ground water recharge;
- substantially degrade water quality; and
- alter regional or local hydrology resulting in substantial increases in erosion or sedimentation.

5.5.3 Effects and Mitigation Measures

5.5.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee alternatives would be made to increase the level of protection. No construction-related effects relating to water quality such as earthmoving that result in increased turbidity, or incidental releases of construction-related contaminants would occur. Therefore, there would be no effect on surface or groundwater quality or resources attributable to the implementation of the No Action Alternative.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to seepage or slope stability or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Water Quality and Groundwater Resources program analysis (Section 3.3.3.3.1). In summary, those effects could include spreading of contaminants from stored chemicals, septic systems, and flooded vehicles into the Sacramento Bypass, Yolo Bypass, Delta, and other nearby waterways, as well as potentially contaminating soils and groundwater. Loss of eroded levee foundation and eroded topsoil from inundated areas would increase turbidity and total dissolved solids in nearby waterways, impairing beneficial uses. Furthermore, if a levee breach were to occur, emergency construction and repair activities would likely be implemented without the use of BMPs and could result in the release of hazardous construction materials such as oil and other petroleum related products. However, the timing, duration and magnitude of a flood event are speculative and unpredictable, and therefore a precise determination of significance is not possible.

5.5.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on water quality and groundwater resources, as described in the program analysis (Section 3.3.3.3, Effects and Mitigation Measures). A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
WQ-1: Effects on Surface Water Quality from Excessive Turbidity or Total Suspended Solids	Less than significant	N/A	
WQ-2: Release of Contaminants into Adjacent Surface Water Bodies from Construction-Related Hazardous Materials	Less than significant	N/A	

Effect	Finding	With Mitigation	Mitigation Measure
WQ-3: Effects on Groundwater or Drinking Water Quality Resulting from Construction and Operation	Significant	Less than significant	WQ-MM-1 Implement Measures to Maintain Surface Water Quality and Groundwater Quality WQ-MM-2: Implement Provisions for Dewatering

Effect WQ-1: Effects on Surface Water Quality from Excessive Turbidity or Total Suspended Solids

Construction of The Rivers APA would require construction-related earth-disturbing activities that potentially cause erosion and sedimentation to adjacent water bodies. Because this type of construction would occur close to the Sacramento River sedimentation and turbidity could occur in the river. Two environmental commitments (see Section 2.9 of Chapter 2, Alternatives for a full description) are included as part of the project that would reduce the likelihood that this effect would occur, or reduce the effect should it occur. These commitments include the development of the SWPPP and monitoring of turbidity during construction activities. Site-specific erosion control measures would be developed as part of a SWPPP, a requirement of the NPDES General Construction Permit. A SWPPP typically contains, but is not limited to, the following described best management practices:

- **Timing of construction.** Conduct earthwork during the typical construction season.
- **Staging of construction equipment and materials.** Stage construction equipment and materials on the landside of the subject levee reaches. To the extent possible, stage equipment and materials in areas that already have been disturbed.
- **Soil and vegetation disturbance.** Minimize ground and vegetation disturbance during construction by establishing designated equipment staging areas, ingress and egress corridors, spoils disposal and soil stockpile areas, and equipment exclusion zones prior to the commencement of any grading operations.
- **Grading spoils.** Stockpile soil and grading spoils on the landside of the subject levee reaches, and install sediment barriers (e.g., silt fences, fiber rolls, straw bales) around the base of stockpiles to intercept runoff and sediment during storm events. If necessary, cover stockpiles with geotextile fabric to provide protection against wind and water erosion.
- **Sediment barriers.** Install sediment barriers on graded or otherwise-disturbed slopes as needed to prevent sediment from leaving the project site and entering nearby surface waters.
- **Site stabilization.** Install native plant materials to stabilize cut and fill slopes and other disturbed areas once construction is complete. Plant materials may include an erosion control seed mixture or shrub and tree container stock. Temporary structural BMPs, such as sediment barriers, erosion control blankets, mulch, and a mulch tackifier, may be installed as needed to stabilize disturbed areas until vegetation becomes established.

As part of a turbidity monitoring program, WSAFCA or its contractor will monitor turbidity in the adjacent water bodies, where applicable criteria apply, to determine whether turbidity is being affected by construction and ensure that construction does not result in a rise in turbidity levels above ambient conditions, in accordance with the Central Valley RWQCB Basin Plan turbidity

objectives. The monitoring program will include monitoring ambient turbidity conditions upstream and 200 feet downstream of construction activities. Grab samples will be collected at a downstream location that is representative of the flow near the construction site. If there is a visible sediment plume being created from construction, the sample should represent this plume. Since construction is not proposed to encroach upon the Sacramento River, monitoring should occur once a week on a random basis.

If turbidity limits exceed Basin Plan standards, construction-related earth-disturbing activities will slow to a point that results in alleviating the problem. WSAFCA or its contractor will notify the Central Valley RWQCB of the issue and provide an explanation of the cause. The implementation of these environmental commitments would reduce any potential effects to a less-than-significant level.

Effect WQ-2: Release of Contaminants into Adjacent Surface Water Bodies from Construction-Related Hazardous Materials

The Rivers project construction activities will involve storage, use, or discharge of toxic and other harmful substances near the Sacramento River (or in areas that drain to the Sacramento River or other water bodies). Construction activities would involve the use of heavy equipment, cranes, compactors and other construction equipment that uses petroleum products (e.g., fuels, lubricants, hydraulic fluids, coolants). All of these materials may be toxic to fish and other aquatic organisms. An accidental spill or inadvertent discharge of these materials could affect the water quality of the river or water body.

There are three environmental commitments included in the program that would reduce the effect of such a release should it occur or reduce the likelihood that a release would occur. These environmental commitments include the development of the SWPPP, SPCCP and a bentonite slurry spill contingency plan (BSSCP). Typical elements of the SWPPP are described above under Effect WQ-1. All three environmental commitments are described in detail in Section 2.9 of Chapter 2, Alternatives, and are summarized below.

An SPCCP is intended to prevent any discharge of oil into navigable water or adjoining shorelines. WSAFCA or its contractor will develop and implement an SPCCP to minimize the potential for and effects from spills of hazardous, toxic, or petroleum substances during construction and operation activities. The SPCCP will be completed before any construction activities begin. Implementation of this measure will comply with state and Federal water quality regulations. The SPCCP will describe spill sources and spill pathways in addition to the actions that would be taken in the event of a spill (e.g., an oil spill from engine refueling would be immediately cleaned up with oil absorbents). The SPCCP will outline descriptions of containments facilities and practices such as doubled-walled tanks, containment berms, emergency shut-offs, drip pans, fueling procedures and spill response kits. It will also describe how and when employees are trained in proper handling procedure and spill prevention and response procedures.

A BSSCP is typically developed for activities that involve the use of bentonite materials (e.g., the construction of slurry walls). The BSSCP is intended to minimize the potential for a frac-out associated with excavation and tunneling activities, provide for timely detection of frac-outs, and ensure and “minimum-effect” response in the event of a frac-out and release of excavation fluid (i.e., bentonite used for the construction of slurry walls).

Release of contaminants into adjacent water bodies could result in significant effects. Adherence to these environmental commitments and the implementation of Mitigation Measure WQ-MM-1 should spills occur would reduce this effect to less than significant.

Mitigation

Mitigation Measure WQ-MM-1: Implement Measures to Maintain Surface Water Quality and Groundwater Quality

If an appreciable spill has occurred and results determine that project activities have significantly affected surface or groundwater quality, a detailed analysis will be performed by a registered environmental assessor or professional engineer to identify the likely cause of contamination. This analysis will conform to American Society for Testing and Materials (ASTM) standards and will include recommendations for reducing or eliminating the source or mechanisms of contamination. Based on this analysis, WSAFCA and its contractors will select and implement measures to control contamination, with a performance standard that surface water quality and groundwater quality must be returned to baseline conditions.

Effect WQ-3: Effects on Groundwater or Drinking Water Quality Resulting from Construction and Operation

Trenching and excavation associated with slurry wall construction may reach a depth that could expose the water table, in which case an immediate and direct path to the groundwater basin would become available for contaminants to enter the groundwater system. Primary construction-related contaminants that could reach groundwater include increased sediment, oil and grease, and hazardous materials.

In addition, while dewatering of the construction area (e.g., trenches dug for slurry wall construction that may be filled with groundwater) is not expected to occur to implement the flood program alternatives, if it became necessary, it could result in the release of contaminants to surface or groundwater.

The construction of a slurry cutoff wall is not expected to require digging or trenching at depths where groundwater aquifers utilized for drinking water occur. If trenching activities were to incidentally reach a groundwater aquifer utilized for drinking water, the slurry wall material is relatively benign and would not remain in a liquid state long enough to allow for significant lateral movement within the aquifer.

As discussed in Section 5.19, Public Health and Hazards, prior to all construction activities, the WSAFCA will complete Phase I and, if necessary, Phase II Environmental Site Assessment Investigations that will include analysis of soil and/or groundwater samples for the potential contamination sites that have not yet been covered by previous investigations. If hazardous substances are found, WSAFCA or its contractor will implement required measures for the proper transport and disposal of such materials in accordance with the appropriate local, state and Federal laws and regulations.

Currently, there is a known plume of groundwater contamination near The Rivers EIP project area (Figure 3.3-1). The plume is a result of multiple leaking underground storage tanks, removed in 1994, located at the DWR Maintenance Yard. There are some private drinking water wells in this area and through installation and use of monitoring wells, DWR continues to monitor the plume to determine its flow patterns and to ensure minimal effects on drinking water wells. The leaking

storage tanks were discovered in 1994 and have since been fixed (California Department of Water Resources 2009).

Of the multiple monitoring wells shown on Figure 3.3-1, three are used for groundwater quality sampling (MW-1, MW-2 and MW-3). The three on-site wells were routinely sampled for aromatic volatile organic compounds benzene, toluene, ethylbenzene, and total xylenes (BTEX), along with gasoline additive oxygenate compounds. These oxygenates include methyl tertiary butyl ether (MTBE), di-isopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), tertiary amyl methyl ether (TAME), and tertiary butyl alcohol (TBA) (California Department of Water Resources 2009).

The latest quarterly monitoring report results showed no detectable concentrations of contaminants of concern at or above laboratory reporting limits. However, past sampling and analysis have determined that MTBE is the main contaminant of concern on the site. (California Department of Water Resources 2009.) No other contaminants of concern were ever detected at or above the laboratory reporting limits from any of the monitoring wells.

In addition to groundwater quality sampling, groundwater elevation is also monitored. Groundwater elevations were measured ranging from 6.71 feet on June 3, 2009 (MW-13) (eastern most portion of the plume on the land side of the levee), to 9.21 feet on April 27, 2009 (MW-8, northern south side of the plume) (California Department of Water Resources 2009). During that same period the depth to groundwater was approximately 29 to 35 feet below ground surface (bgs) on the levee, and 13 to 15 feet bgs south of the levee and the plume (California Department of Water Resources 2009). DWR concluded that groundwater levees correlate to the Sacramento River stage and data from the levels indicate that the groundwater appears to flow east (see Figure 3.3-1 for flow direction).

Construction of the slurry wall is expected to be 2 to 3 feet wide and reach a depth from 80 to 135 feet bgs, which is much deeper than the 29- to 35-foot depth to groundwater. In addition, the slurry wall would bisect a small portion of the north side of the groundwater plume (Figure 3.3-1). Based on the groundwater flow direction (see Figure 3.3-1), the slurry wall would not redirect the contaminated plume to any known drinking water wells in the area. In addition, the small area of the plume (see shaded area on Figure 3.3-1) on the river side of the slurry wall would be blocked by the slurry wall from migrating towards the elementary school. This portion of the plume would likely travel along the north side of the slurry wall with the flow direction of the Sacramento River. Exact travel time is unknown, so it is unclear as to how long it would take this portion of the plume to pass the slurry wall approximately 2,000 feet downstream. However, since groundwater travel time is extremely slow, potential contamination would be slowly diluted over a long period of time.

DWR recommends that groundwater quality and elevation sampling continue indefinitely on a quarterly basis along with installation of new monitoring wells in strategic locations following the groundwater flow direction to characterize any potential movement of the plume (California Department of Water Resources 2009).

Effect on groundwater and drinking water quality from operation and construction may be significant. However, WSAFCA will adhere to environmental commitments of the SWPPP, the SPCCP, and the BSSCP, as summarized above under Effects WQ-1 and WQ-2. Adherence to those environmental commitments and the implementation of Mitigation Measures WQ-MM-1 and WQ-MM-2 would reduce any effects to less than significant.

Mitigation

Mitigation Measure WQ-MM-1 Implement Measures to Maintain Surface Water Quality and Groundwater Quality

Mitigation Measure WQ-MM-2: Implement Provisions for Dewatering

Before discharging any dewatered effluent to surface water, WSAFCA or its contractors will obtain a Low Threat Discharge and Dewatering NPDES permit from the Central Valley RWQCB. Depending on the volume and characteristics of the discharge, coverage under the Central Valley RWQCB's NPDES General Construction Permit or General Dewatering Permit is possible. As part of the permit, the permittee will design and implement measures as necessary so that the discharge limits identified in the relevant permit are met. For example, if dewatering is needed during the construction of the slurry wall at The Rivers EIP project area, then the Low Threat Discharge and Dewatering NPDES permit would require proper disposal of the water due to the known petroleum plume present in the area. As a performance standard, these measures will be selected to achieve maximum sediment removal and represent the best available technology that is economically achievable. Implemented measures may include the retention of dewatering effluent until particulate matter has settled before it is discharged, use of infiltration areas, and other BMPs. Final selection of water quality control measures will be subject to approval by WSAFCA.

WSAFCA will verify that coverage under the appropriate NPDES permit has been obtained before allowing dewatering activities to begin. WSAFCA or its agent will perform routine inspections of the construction area to verify that the water quality control measures are properly implemented and maintained. WSAFCA will notify its contractors immediately if there is a non-compliance issue and will require compliance.

5.5.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on water quality and groundwater resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
WQ-1: Effects on Surface Water Quality from Excessive Turbidity or Total Suspended Solids	Less than significant	N/A	
WQ-2: Release of Contaminants into Adjacent Surface Water Bodies from Construction-Related Hazardous Materials	Less than significant	N/A	
WQ-3: Effects on Groundwater or Drinking Water Quality Resulting from Construction and Operation	Significant	Less than significant	WQ-MM-1 Implement Measures to Maintain Surface Water Quality and Groundwater Quality WQ-MM-2: Implement Provisions for Dewatering

Effect WQ-1: Effects on Surface Water Quality from Excessive Turbidity or Total Suspended Solids

This effect is the same as described above under The Rivers APA. This effect is considered less than significant. No mitigation is required.

Effect WQ-2: Release of Contaminants into Adjacent Surface Water Bodies from Construction-Related Hazardous Materials

This effect is the same as described above under The Rivers APA. This effect is considered less than significant. No mitigation is required.

Effect WQ-3: Effects on Groundwater or Drinking Water Quality Resulting from Construction and Operation

This effect is the same as described above under The Rivers APA. This effect is considered less than significant with the implementation of mitigation measures WQ-MM-1 and WQ-MM-2, also described above.

Section 5.6

Geology, Seismicity, Soils, and Mineral Resources—The Rivers Early Implementation Project

5.6.1 Affected Environment

This section describes the affected environment for geology, seismicity, soils, and mineral resources in The Rivers EIP project area, including the regulatory and environmental setting.

5.6.1.1 Regulatory Setting

5.6.1.1.1 State

The following state policies related to geology, seismicity, soils, and mineral resources may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.4.2.1, Regulatory Setting, for a more complete description of each policy.

- Alquist-Priolo Earthquake Fault Zoning Act
- Seismic Hazards Mapping Act
- California Building Standards Code
- California Surface Mining and Reclamation Act

5.6.1.1.2 Local

The following local policies related to geology, seismicity, soils, and mineral resources may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.4.2.1, Regulatory Setting, for a more complete description of each policy.

- *Draft 2030 Countywide General Plan* for Yolo County
- *City of West Sacramento General Plan*
- Grading and Erosion Control Ordinances

5.6.1.2 Environmental Setting

This section discusses the environmental setting related to soil characteristics, mineral resources, and seismic hazards for The Rivers EIP.

5.6.1.2.1 Study Area

Geology and Topography

The surface and subsurface distributions of sandy and clayey deposits in The Rivers EIP project area are a function of former river positions on the landscape, present-day geomorphic processes adjacent to the river positions on the landscape, and present-day geomorphic processes adjacent to

the river channel (i.e., flooding and deposition) (William Lettis & Associates 2007). Helley and Harwood (1985) compiled previous regional studies of the quaternary geology of the Sacramento Valley. Previous geologic mapping in the West Sacramento study area generalized the surficial deposits as Quaternary alluvium (Qa) proximal to the modern river channel and undifferentiated Quaternary basin (Qb) deposits away from the modern river channel. Helley (1985) differentiates basin deposits from alluvium on the basis of composition, including only those deposits that are finer-grained and frequently organic-rich, and suggests these deposits were distal deposits where energy conditions were much lower. Both of these map units are considered Holocene age.

5.6.1.2.2 Soils

The Rivers EIP project area comprises two distinct soil map units as identified by the USDA Conservation Service (U.S. Department of Agriculture Soil Conservation Service 1972): Lang sandy loam and Sycamore silt loam (Figure 5.6-1). These soil types are characterized in Table 3.4-2, Section 3.4.2.2.2. The under-seepage deficiencies identified at The Rivers project area are caused primarily by the presence at depth of coarse, permeable soils (sands and gravels) that translate hydraulic pressure during flood stage beneath the levees and destabilize them. In other words, the coarse-textured soil material common to the Lang and Sycamore soil series found at The Rivers project area facilitates seepage pathways, which compromise levee integrity.

5.6.1.2.3 Mineral Resources

No commercial mining operations are known to have occurred in West Sacramento. Most of the area is classified as MRZ-1 by the California Division of Mines and Geology, which indicates no significant mineral deposits are present. The portion of the West Sacramento area that borders the Sacramento River (and henceforth the study area vicinity) is classified as MRZ-3, which means aggregate deposits of undetermined significance occur there. Lands classified as MRZ-1 or MRZ-3 are not affected by state policies pertaining to the maintenance of access to regionally significant mineral deposits under the California Surface Mining and Reclamation Act of 1975.

5.6.1.2.4 Seismic Hazards

Seismic hazards refer to earthquake fault ground rupture and ground shaking (primary hazards), as well as liquefaction and earthquake-induced slope failure (secondary hazards). Localized ground shaking and liquefaction are the most significant seismic hazards in Yolo County (Yolo County 1983).

Primary Seismic Hazards—Surface Fault Rupture[1] and Groundshaking

The project area is located in a region of California characterized by low seismic activity. The UBC recognizes no active seismic sources in the project vicinity (International Conference of Building Officials 1997), and no active faults are known to cross the project area. The project area is located within UBC Seismic Hazard Zone 3. Refer to the program description for further information.

[1] *Surface fault rupture* is a rupture at the ground surface along an active fault, caused by earthquake or creep activity.

Figure 5.6-1
Soil Types at The Rivers Early Implementation Site

Q:\PROJECTS\HDR\00875_07\MAPDOC\SOILS\RIVERS_SOIL_MAP_8_1_2X11_20091118.MXD SS (11-19-09)

Liquefaction

Poorly consolidated, water-saturated fine sands located within 30 to 50 feet of the surface typically are considered the most susceptible to liquefaction. Soils and sediments that are not water-saturated and that consist of coarser or finer materials are generally less susceptible to liquefaction (California Division of Mines and Geology 1997).

URS performed a liquefaction-triggering analysis to evaluate whether any levee or underlying foundation materials potentially would liquefy during the considered earthquake events. Criteria for susceptibility to liquefaction included soil type, liquid limit, plasticity index, water content, and fines content. If the material was considered to be susceptible to liquefaction, steps were completed to further evaluate the liquefaction potential of the material considering the earthquake loading. In contrast, if the plasticity of the material was high enough to preclude liquefaction, the material was classified as non-liquefiable, irrespective of the earthquake loading (URS 2007). The Sacramento River North Levee may exhibit liquefaction during a seismic event. (HDR, Inc. 2008a.)

5.6.2 Environmental Consequences

This section describes the environmental consequences relating to geology, seismicity, soils, and mineral resources for the proposed Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects described in Section 3.4.3.3, Effects and Mitigation Measures.

5.6.2.1 Assessment Methods

Evaluation of the geology, seismicity, and soils effects in this section is based on the information provided by technical maps, reports, and other documents that describe the geologic, seismic, and soil conditions of the study area. This information was then compared to the type and location of proposed flood and recreation alternatives to determine whether effects would occur.

5.6.2.2 Determination of Effects

Criteria for determining the significance of effects related to geology, soils, and mineral resources were developed based on the environmental checklist form in Appendix G of the State CEQA Guidelines (14 CCR 15000 *et seq.*). An effect related to geology, soils, and seismicity was considered significant if it would:

- expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
- rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the state geologist for the area or based on other substantial evidence of a known fault (refer to Division of Mines and Geology Special Publication 42);
- strong seismic ground shaking;

- seismic-related ground failure, including liquefaction; or
- landslides;
- result in substantial soil erosion or the loss of topsoil;
- be located on a geologic unit or soil that is unstable or that would become unstable as a result of the project and potentially result in an on-site or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse;
- be located on expansive soil, as defined in Table 18-1-B of the UBC (1994), creating substantial risks to life or property;
- have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems in areas where sewers are not available for the disposal of wastewater;
- result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state; or
- result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan.

5.6.3 Effects and Mitigation Measures

5.6.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects involving direct ground-disturbing activities or changes to flood control facilities that could result in changes in geology, seismicity, soils, or mineral resources would occur.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to seepage or slope stability or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Geology, Seismicity, and Soils program analysis (Section 3.4.3.3.1). In summary, these effects could include loss of topsoil, additional levee collapse, alteration of regional and local hydrology, and an increase in erosion and sedimentation. It is assumed that these effects would be significant; however, given the uncertainty of the occurrence or magnitude of such an event, the effects cannot be quantified based on available information.

Furthermore, the beneficial effects attributable to program implementation such as improved levee stability and decreased levee bank erosion would not be realized under the No Action Alternative.

5.6.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on geology, seismicity, soils, and mineral resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
GEO-1: Effects on Levee Stability	Beneficial	N/A	N/A
GEO-3: Effects Resulting from Seismic Groundshaking and Liquefaction	Less than significant	N/A	N/A
GEO-4: Accelerated Erosion and Sedimentation Resulting from Construction-Related Ground Disturbance	Less than significant	N/A	N/A

Effect GEO-1: Effects on Levee Stability

The proposed slope flattening would improve the stability of the Sacramento Bypass Levee by further reducing seepage and the potential for seepage-related failures by reducing hydrostatic exit gradients, creating more stable slopes and reducing erosion. Therefore, this effect would be beneficial.

Effect GEO-3: Effects Resulting from Seismic Groundshaking and Liquefaction

Based on available knowledge of fault location and locations of earthquake epicenters, the risk of groundshaking in the study area is low. Nonetheless, a large earthquake on a nearby fault could cause groundshaking in the study area, which could result in liquefaction or associated ground failure, such as lateral spreading or differential settlement which could in turn result in structural loss, injury, and death.

The Sacramento River North Levee contains soils that may be subject to liquefaction. Implementation of the proposed project would not substantially alter the composition of the subject levees or foundation soils or increase their susceptibility to liquefaction. The project does propose the construction of a slurry cutoff wall to reduce seepage and increase flood control that might sustain damage from groundshaking or liquefaction and endanger people during a seismic event.

However, the potential for failure of this structure from groundshaking would depend on the degree of levee saturation during an earthquake. A high level of saturation would likely only occur during a major flood event. The probability that a large regional earthquake would occur during a major flood event is relatively low, but such coincidence is not impossible. Nonetheless, because of the relative small likelihood of such coincidental events, and because the expected magnitude of groundshaking from large regional earthquakes is relatively low in the study area, the potential for failure or damage of the slurry cutoff wall is considered to be less than significant. No mitigation is required.

Effect GEO-4: Accelerated Erosion and Sedimentation Resulting from Construction-Related Ground Disturbance

The grading, trenching, and other earthwork that would be conducted during construction of the CHP APA would result in substantial ground and vegetation disturbance. These disturbances would

increase the hazard of erosion and could temporarily increase erosion and sedimentation rates above existing levels. Because most of the earthwork would be conducted on and immediately adjacent to the levee, accelerated erosion and sedimentation resulting from construction-related ground and vegetation disturbance would not result in the loss of appreciable quantities of topsoil resources. In addition, most ground-disturbing activities would occur during the typical construction season, when conditions are generally dry, further reducing the potential for construction-related erosion.

Site-specific measures that would control erosion would be described in more detail in the SWPPP, which is included in the environmental commitments of the program, described in further detail in Section 2.9 of Chapter 2, Alternatives, and summarized in Section 5.5, Water Quality of this chapter. The SWPPP is a requirement of the NPDES General Construction Permit.

In addition, WSAFCA or its contractor would monitor turbidity in the Sacramento River to determine whether turbidity is being affected by construction and ensure that construction does not affect turbidity levels or acceptable sedimentation loads (as discussed in Section 3.3, Water Quality and Groundwater Resources). With these project-level actions, erosion and sediment-related effects would be less than significant. No mitigation is required.

5.6.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on geology, seismicity, soils, and mineral resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
GEO-1: Effects on Levee Stability	Beneficial	N/A	N/A
GEO-3: Effects Resulting from Seismic Groundshaking and Liquefaction	Less than significant	N/A	N/A
GEO-4: Accelerated Erosion and Sedimentation Resulting from Construction-Related Ground Disturbance	Less than significant	N/A	N/A

Effect GEO-1: Effects on Levee Stability

This effect is the same as that described under The Rivers APA, above. This effect is considered beneficial.

Effect GEO-3: Effects Resulting from Seismic Groundshaking and Liquefaction

This effect is the same as that described under The Rivers APA, above, with the exception that the structure that could potentially sustain damage is a sheet pile wall rather than a slurry cutoff wall. This effect is considered less than significant. No mitigation is required.

Effect GEO-4: Accelerated Erosion and Sedimentation Resulting from Construction-Related Ground Disturbance

This effect is the same as that described under The Rivers APA, above. This effect is considered less than significant. No mitigation is required.

Section 5.7

Transportation and Navigation—The Rivers Early Implementation Project

5.7.1 Affected Environment

This section describes the affected environment for transportation and navigation in The Rivers EIP project area, including the regulatory and environmental settings.

5.7.1.1 Terminology

The following are definitions of key traffic and transportation terms used in this section, in addition to the definitions provided in Section 3.5.1.1.

- **Annual average daily traffic (AADT)**: AADT is the total volume for the year divided by 365 days.
- **Peak Hour:** This is an estimate of the "peak hour" traffic at all points on the state highway system.
- **Back and Ahead**: Back AADT, Peak Month, and Peak Hour usually represent traffic south or west of the count location. Ahead AADT, Peak Month, and Peak Hour usually represent traffic north or east of the count location.

5.7.1.2 Regulatory Setting

5.7.1.2.1 Federal

The following Federal policies related to transportation and navigation may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.5.2.1, Regulatory Setting, for a more complete description of each policy.

- River and Harbors Appropriation Act of 1899

5.7.1.2.2 Local

The following local policies related to transportation and navigation may apply to the implementation of The Rivers EIP. Please see Section 3.5.2.1, Regulatory Setting, for a more complete description of each policy.

- *City of West Sacramento General Plan*
- *Yolo County General Plan*

5.7.1.3 Environmental Setting

This section discusses the environmental setting related to transportation and navigation in the study area for The Rivers EIP.

5.7.1.3.1 Roadways

Existing freeways within or near the project area are described below.

- **Interstate 80 (I-80)** is a major freeway that runs northeast to southwest, west of the project area. I-80 heads towards Reno to the east and San Francisco to the west. The freeway runs above the Sacramento River North Levee.
- **Highway 50 (US 50)** is a major highway that runs east to west, south of the project area. US 50 heads toward Carson City to the east and merges with I-80 on the western side of West Sacramento as it heads toward San Francisco.

Table 5.7-1 shows the Back and Ahead AADT for the highway segments that would be most affected by project-related traffic.

Table 5.7-1. AADT for Highways in The Rivers Project Area

Highway	Segment	Back AADT	Ahead AADT
I-80	Junction with Route 50	145,000	85,000
I-80	Junction with Route 84 (Reed Avenue)	85,000	90,000
I-80	West El Camino Avenue Interchange	90,000	87,000
US 50	Junction with Route 80	–	85,000
US 50	Harbor Boulevard Interchange	85,000	116,000
US 50	Junction with Route 84	116,000	109,000
US 50	Junction with Route 5	177,000	226,000

Source: California Department of Transportation 2009.

The major arterial streets that serve the study area or that may be affected by project implementation are:

- **West Capitol Avenue (SR 275)** is an east-west arterial that runs between I-80 near the western city limits of West Sacramento and the Tower Bridge at the Sacramento River. The roadway width varies between two, four, and six lanes.
- **Reed Avenue/Sacramento Avenue/C Street (SR 84)** runs east-west, between I-80 near the western city limits and the I Street Bridge at the Sacramento River, and lies 0.75 mile south of the project area. The roadway width varies between two and four lanes. Under LOS Criteria for Roadway Segments, Reed Avenue is classified as a four-lane arterial with moderate access control for the four-lane sections. Sacramento Avenue is classified as a four- and two-lane arterial with moderate access control.
- **Harbor Boulevard** is a north-south arterial that runs through the western portion of the city. The roadway width varies between two and four lanes, and has moderate access control.
- **Jefferson Boulevard (SR 84)** is a major arterial that extends from Sacramento Avenue to south of city limits. Jefferson Boulevard is a four-lane road with low access control from Sacramento Avenue to just south of South Linden Road.

Local roads that would provide access to The Rivers project area include Fifth Street, Lighthouse Drive, and River Crest Drive. Fifth Street begins near the eastern end of West Capitol Avenue and heads north to where it becomes Lighthouse Drive. Fifth Street is classified as a four-lane arterial

road with moderate access control. Lighthouse Drive starts at A Street and runs north, then curves to the west. The section of Lighthouse Drive that runs south to north is classified as a four-lane arterial road with low access control, and then becomes a two-lane residential collector road with access as it runs east to west. River Crest Drive runs along the crown of the Sacramento River North Levee, and lies within The Rivers gated community. River Crest Drive is classified as a residential road. The levee road that runs along the Sacramento River North levee crown would provide access as well; however, this road is used for maintenance purposes and has no public access. Table 5.7-2 shows the ADT, peak-hour traffic, and LOS for the major roadways in the project area.

Table 5.7-2. ADT, Peak-Hour Traffic, and LOS for Roadways in The Rivers Project Area

Street	Limits	ADT	AM Peak	PM Peak	LOS	Count Year
West Capitol Avenue	Riske Lane to 3rd Street	4,337	251	408	A	2005
Reed Avenue	Riverside Parkway to Sunset Avenue	15,930	1,036	1,229	A	2005
Sacramento Ave	Sunset Ave to Kegle Dr	10,437	995	885	A	2006
Sacramento Ave	Kegle Dr. to 6th St	9,517	541	812	A	2007
Harbor Boulevard	Rice Ave to West Capitol Ave	15,464	1,050	1,257	A	2008
Harbor Boulevard	Reed Ave to Rice Ave	15,399	869	1,195	A	2007

Lighthouse Drive	Fountain Drive to A Street	2,890	167	149	A	2006

Source: City of West Sacramento 2007.

According to the City of West Sacramento's Level of Service standards, all roads that lie within or near the project area are of an acceptable level of service, with the exception of Harbor Boulevard (West Capitol Avenue to Industrial Boulevard) and Jefferson Boulevard (West Capitol Avenue to 15th Street).

5.7.1.3.2 Parking

On-street parking in the project area is limited to the shoulders of the local roads, including Riverbank Road, Rivercrest Road, and Fountain Drive. At the eastern end of Riverbank Road, near its terminus, there are two parking lots. One parking lot is for the Club West Teen Center, and the other is for Riverbank Elementary School. Both parking lots are only accessible via Riverbank Road. The City does not have any public parking lots in the project area. Construction projects are subject to off-street parking standards as defined in the City's Zoning Ordinance (City of West Sacramento 2000).

5.7.1.3.3 Railroads

No railroads lie within the project area. The closest railroad tracks to the project area belong to the Union Pacific Railroad, which lie approximately 0.75 mile southwest of the project area.

5.7.1.3.4 Transit Facilities

No bus lines or other transit facilities are located within the project area.

5.7.1.3.5 Bikeways

Bicycle facilities are currently available in the project vicinity. Major arterial roads as well as several minor arterial roads throughout the city have bike lanes or bike accessible shoulders. Bike accessible areas that run adjacent to or on top of levees in the project area include Riverbank Road, Rivercrest Road, and Fountain Drive (Sacramento River North Levee) (City of West Sacramento 2009a).

5.7.1.3.6 Airports

Airports in the area include Sacramento International Airport, Sacramento Executive Airport, Mather Airport, and Franklin Field. Sacramento International Airport is Sacramento County owned and is located approximately 7 miles to the north of the city, between Sacramento and Woodland along I-5. The Executive Airport is owned by Sacramento County and is located 1.5 mile to the east of the City, within the city of Sacramento. Mather Field is a military airfield located approximately 11 miles east of the City in Rancho Cordova. Franklin Field is owned by Sacramento County and is located approximately 16 miles south of the City in Elk Grove.

5.7.1.3.7 Navigation

The Sacramento River is the only permanent waterway that lies adjacent to the project area. The river flows in a generally southward direction past the Sacramento River North Levee. The river is approximately 600 feet wide where it passes the project area, however widths vary depending on water elevations. Navigation in the Sacramento River is limited to recreational watercraft because the river is too small and fluctuating water levels prevent the accommodation of large commercial vessels.

On the West Sacramento bank, within the project vicinity, there are no docks or other access points to the river for watercraft. On the city of Sacramento side, there are several private docks that belong to homeowners living on top of or adjacent to the levee. The closest access point for watercraft on the West Sacramento side of the river is the Broderick boat ramp, which is approximately a mile and a half downriver from the eastern edge of the project area.

5.7.2 Environmental Consequences

This section describes the environmental consequences relating to transportation and navigation for The Rivers EIP project area. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP project, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis, are fully described in Section 3.5.3.3, Effects and Mitigation Measures.

5.7.2.1 Assessment Methods

The proposed project would construct levee alternatives along a section of the Sacramento River North Levee. Because of the earthwork involved and the need for materials deliveries, construction would intermittently generate substantial volumes of traffic. Once the construction is completed, maintenance needs would be similar to existing conditions. Analysis of traffic effects therefore concentrated on the construction of levee alternatives.

For the purposes of analysis, the effects of these project activities were analyzed according to truck and worker trip effects on roadway operation and circulation. Haul routes for The Rivers EIP are shown on Figure 5.7-1.

The analysis used estimated construction traffic generation (expressed as average trips per day) to develop a qualitative evaluation of short-term effects on the local and regional roadway in the project vicinity. Table 5.7-3 summarizes construction-related trips anticipated for The Rivers APA and The Rivers Alternative B, which includes trips generated by trucks hauling away excavated materials, and trucks delivering construction equipment and materials. Daily truck trips required to haul away excavated spoils and import fill materials are estimated based on a typical capacity of 20 cubic yards per truck. Each truck and each work would generate two construction-related trips. A detailed list of construction equipment, construction areas, daily and total excavation, and daily and total imported material for each phase are included in the Appendix E.

The key effects were identified and evaluated based on the environmental characteristics of The Rivers EIP project area and the magnitude, intensity, and duration of activities related to the construction of this project.

Table 5.7-3. Estimated Daily Construction Traffic by Alternative and Construction Phase

5.7.2.2 Determination of Effects

For this analysis, a transportation effect was considered significant if it would result in any of the following outcomes, which are based on professional practice, State CEQA Guidelines Appendix G, *City of West Sacramento General Plan Policy Document*, and the City's LOS policies:

- cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in the number of vehicle trips, the V/C ratio on roads, or congestion at intersections);
- cause, either individually or cumulatively, exceedance of a LOS standard established by the City and/or the California Department of Transportation (Caltrans) for designated roads or highways;
- substantially alter present patterns of circulation or movement;
- substantially increase hazards because of a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., slow-moving vehicles);
- result in inadequate emergency access;
- result in inadequate parking capacity; or
- conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks); or substantially impede navigation of watercraft as a result of the installation of cofferdams or the staging of barges within navigable sections of the surrounding waterways.

5.7.3 Effects and Mitigation Measures

5.7.3.1 No Action Alternative

The No Action Alternative represents the continuation of the existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. Under the No Action Alternative, there would be no change in the characteristics of the regional transportation system, local roadways, or navigation in the project area. It is likely that the levee roads and other roads in the program area would continue to be maintained by the City. No road modifications, including the

raising and building of new roads, would occur, and navigation would not change under the No Action Alternative.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to seepage or slope stability or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Transportation and Navigation program analysis (Section 3.5.3.3.1). In summary, those effects could include widespread damage to the city's utilities, roadways, railways, major interstate transportation corridors, and other infrastructure systems, interrupting emergency response services and hindering the region's and the state's abilities to move goods and people. However, the timing, duration and magnitude of a flood event are speculative and unpredictable, and therefore a precise determination of significance is not possible.

5.7.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on transportation and navigation. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
TN-1: Temporary Increase in Traffic Volumes from Construction-Generated Traffic	Less than significant	N/A	N/A
TN-2: Temporary Road Closures or Restricted Access to Parking on the Levee Crown or Roads That Run Adjacent to the Levee	Significant and unavoidable	Significant and unavoidable	No feasible mitigation
TN-3: Increase in Safety Hazards Attributable to Construction-Generated Traffic	Less than significant	N/A	N/A
TN-4: Increase in Emergency Response Times	Less than significant	N/A	N/A
TN-5: Inadequate Parking Supply to Meet Parking Demand for Construction Equipment and Construction Workers	Less than significant	N/A	N/A
TN-6: Disruption of Alternative Transportation Modes as a Result of Temporary Road Closures	Less than significant	N/A	N/A

Effect TN-1: Temporary Increase in Traffic Volumes from Construction-Generated Traffic

Implementation of The Rivers APA would require hauling of construction equipment and materials to The Rivers EIP project area along major highways and over surface streets in the city (Figure 5.7-1).

The use of highways to haul construction equipment and materials to and from The Rivers EIP project area would increase daily traffic. Additionally, many of the construction-generated trips would involve slow-moving trucks, which would further affect highway traffic. However, the increase in AADT would be relatively small. With the addition of the maximum daily construction-generated traffic shown in Table 5.7-3 to the AADT counts in Table 5.7-1, the maximum increase in traffic along any of the segments would be 0.43%. This increase in AADT is not expected to

significantly degrade the operation of highways near the project area. This effect is considered less than significant.

Table 5.7-4 shows the existing ADT levels on the surface streets to be used as haul routes for The Rivers APA with the maximum daily construction-generated traffic shown in Table 5.7-3.

Table 5.7-4. Existing and Projected ADT on Haul Routes for The Rivers APA

Street	Limits	Existing ADT	Existing LOS	Max Trips/Day	ADT During Construction
West Capitol Avenue	Riske Lane to 3rd Street	4,337	A	368	4,705
Reed Avenue	Riverside Parkway to Sunset Avenue	15,930	A	368	16,298
Sacramento Ave	Sunset Ave to Kegle Dr	10,437	A	368	10,805
Sacramento Ave	Kegle Dr. to 6th St	9,517	A	368	9,885
Harbor Boulevard	Rice Ave to West Capitol Ave	15,464	A	368	15,832
Harbor Boulevard	Reed Ave to Rice Ave	15,399	A	368	15,767
Harbor Boulevard	West Capitol Ave to Industrial Blvd	30,135	D	368	30,503
Jefferson Boulevard	Sacramento Ave to West Capitol Ave	21,176	A	368	21,544
Jefferson Boulevard	West Capitol Ave to 15th St	33,705	E	368	34,073
5th Street	A Street to West Capitol Avenue	5,358	A	368	5,726
Lighthouse Drive	Fountain Drive to A Street	2,890	A	368	3,258

The construction traffic generated by The Rivers APA would temporarily increase the daily and peak hour traffic along specified routes shown in Table 5.7-4; however, traffic levels on haul route roads would return to normal levels once construction is completed. These routes would operate well within the City's LOS standard, with the exception of Jefferson Boulevard from West Capitol Avenue to 15th Street, which would maintain an LOS of E. Harbor Boulevard from West Capitol Avenue to Industrial Boulevard would have an LOS of D; however, the segment is located within 0.25 mile of a freeway interchange, which means the lower LOS is acceptable according to the City's standards. Although this addition of construction-related traffic would not be expected to degrade the LOS on most haul route roads to an unacceptable level, slow-moving heavy trucks could affect traffic flow on these roadways, particularly if numerous trips occur during the morning or afternoon peak traffic periods. Implementation of the traffic control and road maintenance plan environmental commitment, described in Chapter 2, Alternatives, would reduce the effects of construction traffic on all haul routes to a less-than-significant level.

Effect TN-2: Temporary Road Closures on the Levee Crown or Roads That Run Adjacent to the Levee

Implementation of The Rivers APA would result in the temporary closure of Riverbank Road north of Bryte Park, the western section of Fountain Drive, and the western section of Rivercrest Drive. The section of Riverbank Road that is located in the project area provides access only to a parking lot at Riverbank Elementary School before it reaches a dead end, and provides no through-access to any other streets.

The temporary closure of sections of Fountain Drive and Rivercrest Road would prevent home access and parking for 15 residences. During periods of time when construction is directly adjacent to their homes, the residents would be temporarily relocated. Therefore, the temporary closure of

these roads would not result in inadequate emergency access or parking, or substantially alter present patterns of circulation as the affected residents would not be in their homes, and neighboring residential roads could be used without affecting emergency access, parking, or circulation to homes adjacent to the project area. Additionally, the closure of roads would be temporary as they would be opened upon completion of the project. Implementation of the traffic control and road maintenance plan environmental commitment, described in Chapter 2, Alternatives, would aid in maintaining traffic standards during construction. However, because residents would lose daily access to their properties, this effect is considered significant and unavoidable. There is no feasible mitigation.

Effect TN-3: Temporary Restriction of Access to Parking

The temporary closure of the section of Riverbank Road north of Bryte Park would remove access to the parking lot on the northern side of Riverbank Elementary School, as well as the parking lot for the Club West Teen Center. However, the school has a parking lot on its southern side, and on-street parking is available in front of the school during periods of construction; therefore, the project would not result in inadequate parking capacity. Access to the northern parking lot would be available again after construction of the project is complete and Riverbank Road is reopened. Implementation of the traffic control and road maintenance plan environmental commitment, described in Chapter 2, Alternatives, would not be needed to reduce the intensity of this effect; however, it would aid in maintaining traffic standards during construction. This effect is less than significant.

Effect TN-4: Increase in Emergency Response Times

Emergency access to The Rivers project vicinity could be affected by construction of the proposed program, and construction-related traffic could delay or obstruct the movement of emergency vehicles. However, execution of the environmental commitment to develop and implement a traffic control and road maintenance plan, described in Section2.9 of Chapter 2, Alternatives, would minimize construction-related effects on emergency response times. This effect would be less than significant.

Effect TN-5: Inadequate Parking Supply to Meet Parking Demand for Construction Equipment and Construction Workers

A parking area for construction workers and trucks would be provided at staging areas adjacent to a work site or areas within the levee right-of-way; therefore, this effect would be less than significant.

Effect TN-6: Disruption of Alternative Transportation Modes as a Result of Temporary Road Closures

Although most of the construction of the proposed program would take place within the project right-of-way, temporary road closures would be needed in some areas, which could interfere with transit services or bicycle travel along these roads. Implementation of the Traffic Control and Road Maintenance Plan environmental commitment, described in Section2.9 of Chapter 2, Alternatives, would minimize construction-related traffic conflicts with alternative modes of transportation. Therefore, this effect would be less than significant. No mitigation is required.

5.7.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on transportation and navigation. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
TN-1: Temporary Increase in Traffic Volumes from Construction-Generated Traffic	Less than significant	N/A	N/A
TN-2: Temporary Road Closures or Restricted Access to Parking on the Levee Crown or Roads That Run Adjacent to the Levee	Significant and unavoidable	Significant and unavoidable	No feasible mitigation
TN-3: Increase in Safety Hazards Attributable to Construction-Generated Traffic	Less than significant	N/A	N/A
TN-4: Increase in Emergency Response Times	Less than significant	N/A	N/A
TN-5: Inadequate Parking Supply to Meet Parking Demand for Construction Equipment and Construction Workers	Less than significant	N/A	N/A
TN-6: Disruption of Alternative Transportation Modes as a Result of Temporary Road Closures	Less than significant	N/A	N/A

Effect TN-1: Temporary Increase in Traffic Volumes from Construction-Generated Traffic

Implementation of The Rivers Alternative B would require hauling of construction equipment and materials to The Rivers EIP project area along major highways and over surface streets in the city (Figure 5.7-1).

The use of highways to haul construction equipment and materials to and from The Rivers EIP project area would increase daily traffic. Additionally, many of the construction-generated trips would involve slow-moving trucks, which would further affect highway traffic. However, the increase in AADT would be relatively small. With the addition of the maximum daily construction-generated traffic shown in Table 5.7-3 to the AADT counts in Table 5.7-1, the maximum increase in traffic along any of the segments would be 0.35%. This increase in AADT is not expected to significantly degrade the operation of highways near the project area. This effect would be less than significant.

Table 5.7-5 shows the existing ADT levels on the surface streets to be used as haul routes for The Rivers Alternative B with the maximum daily construction-generated traffic shown in Table 5.7-3.

Table 5.7-5. Existing and Projected ADT on Haul Routes for The Rivers APA

Street	Limits	Existing ADT	Existing LOS	Max Trips/Day	ADT During Construction
West Capitol Avenue	Riske Lane to 3rd Street	4,337	A	298	4,635
Reed Avenue	Riverside Parkway to Sunset Avenue	15,930	A	298	16,228
Sacramento Ave	Sunset Ave to Kegle Dr	10,437	A	298	10,735
Sacramento Ave	Kegle Dr. to 6th St	9,517	A	298	9,815
Harbor Boulevard	Rice Ave to West Capitol Ave	15,464	A	298	15,762
Harbor Boulevard	Reed Ave to Rice Ave	15,399	A	298	15,697
Harbor Boulevard	West Capitol Ave to Industrial Blvd	30,135	D	298	30,433
Jefferson Boulevard	Sacramento Ave to West Capitol Ave	21,176	A	298	21,474
Jefferson Boulevard	West Capitol Ave to 15th St	33,705	E	298	34,003
5th Street	A Street to West Capitol Avenue	5,358	A	298	5,656

The construction traffic generated by The Rivers Alternative B would temporarily increase the daily and peak hour traffic along specified routes shown in Table 5.7-5: however, traffic levels on haul route roads would return to normal levels once construction is completed. These routes would operate well within the City's LOS standard, with the exception of Jefferson Boulevard from West Capitol Avenue to 15th Street, which would maintain an LOS of E. Harbor Boulevard from West Capitol Avenue to Industrial Boulevard would have an LOS of D; however, the segment is located within 0.25 mile of a freeway interchange, which means the lower LOS is acceptable according to the City's standards. Although this addition of construction-related traffic would not be expected to degrade the LOS on most haul route roads to an unacceptable level, slow-moving heavy trucks could affect traffic flow on these roadways, particularly if numerous trips occur during the morning or afternoon peak traffic periods. Implementation of the traffic control and road maintenance plan environmental commitment, described in Chapter 2, Alternatives, would reduce the effects of construction traffic on all haul routes to a less-than-significant level.

Effect TN-2: Temporary Road Closures on the Levee Crown or Roads That Run Adjacent to the Levee

Implementation of The Rivers Alternative B would result in the temporary closure of Riverbank Road north of Bryte Park, the western section of Fountain Drive, and the western section of Rivercrest Drive. The section of Riverbank Road that is located in the project area provides access only to a parking lot at Riverbank Elementary School before it reaches a dead end, and provides no through-access to any other streets.

The temporary closure of sections of Fountain Drive and Rivercrest Road would prevent home access and parking for approximately 15 residences. During periods of time when construction is directly adjacent to their homes, the residents would be temporarily relocated. Therefore, the temporary closure of these roads would not result in inadequate emergency access or parking, or substantially alter present patterns of circulation as the affected residents would not be in their homes, and neighboring residential roads could be used without affecting emergency access, parking, or circulation to homes adjacent to the project area. Additionally, the closure of roads would only be temporary as they would be opened upon completion of the project. Implementation of the traffic control and road maintenance plan environmental commitment, described in Chapter

2, Alternatives, would aid in maintaining traffic standards during construction. However, because residents would lose daily access to their properties, this effect is considered significant and unavoidable. There is no feasible mitigation.

Effect TN-3: Temporary Restriction of Access to Parking

The temporary closure of the section of Riverbank Road north of Bryte Park would remove access to the parking lot on the northern side of Riverbank Elementary School, as well as the parking lot for the Club West Teen Center. However, the school has a parking lot on its southern side, and on-street parking is available in front of the school during periods of construction; therefore, the project would not result in inadequate parking capacity. Access to the northern parking lot would be available again after construction of the project is complete and Riverbank Road is reopened. Implementation of the traffic control and road maintenance plan environmental commitment, described in Chapter 2, Alternatives, would not be needed to reduce the intensity of this effect; however, it would aid in maintaining traffic standards during construction. This effect is less than significant. No mitigation is necessary.

Effect TN-4: Increase in Emergency Response Times

This effect is the same as that described under The Rivers APA, above. This effect is considered less than significant. No mitigation is required.

Effect TN-5: Inadequate Parking Supply to Meet Parking Demand for Construction Equipment and Construction Workers

This effect is the same as that described under The Rivers APA, above. This effect is considered less than significant. No mitigation is required.

Effect TN-6: Disruption of Alternative Transportation Modes as a Result of Temporary Road Closures

This effect is the same as that described under The Rivers APA, above. This effect is considered less than significant. No mitigation is required.

Section 5.8

Air Quality and Climate Change—The Rivers Early Implementation Project

5.8.1 Affected Environment

This section describes the affected environment for air quality and climate change in The Rivers EIP project area, including the regulatory and environmental settings.

5.8.1.1 Air Quality Regulatory Setting

5.8.1.1.1 Federal

The following Federal policies related to air quality and climate change may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.6.2.1, Regulatory Setting, for a more complete description of each policy.

- Clean Air Act
- General Conformity Regulation
- Federal Tailpipe Emission Standards

5.8.1.1.2 State

The following state policies or agencies related to air quality and climate change may apply to the implementation of The Rivers EIP. Please see Section 3.6.2.1, Regulatory Setting, for a more complete description of each policy.

- California Clean Air Act
- Idling Limit Regulation
- Airborne Toxic Control Measure
- State Tailpipe Emission Standards
- State NO_X Reduction Program

5.8.1.1.3 Local

The following state policies or agencies related to air quality and climate change may apply to the implementation of The Rivers EIP. Please see Section 3.6.2.1, Regulatory Setting, for a more complete description of each policy.

- Yolo-Solano Air Quality Management District
- Sacramento Metropolitan Air Quality Management District

5.8.1.2 Climate Change Regulatory Setting

5.8.1.2.1 Federal

The following Federal policies related to climate change may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.6.2.2, Climate Change Regulatory Setting, for a more complete description of each policy.

- Mandatory Greenhouse Gas Reporting Rule
- Environmental Protection Agency Endangerment cause and Contribute Findings

5.8.1.2.2 State

The following state policies or agencies related to climate change may apply to the implementation of The Rivers EIP. Please see Section 3.6.2.2, Climate Change Regulatory Setting, for a more complete description of each policy.

- Executive Order S-3-05
- Assembly Bill 32, California Climate Solutions Act of 2006
- Senate Bill 97
- Actions Taken by California Attorney General's Office
- California Air Pollution Control Officers Association Guidance
- Executive Order S-13-08

5.8.1.3 Air Quality Environmental Setting

The environmental setting for The Rivers EIP is described in the Program Area Affected Environment. The following provides a summary of air quality and climate change information relevant to climate change and air quality in The Rivers EIP project area.

5.8.1.3.1 Study Area

The study area is in Yolo County, which is located in the Sacramento Valley Air Basin (SVAB). The SVAB includes Sacramento, Shasta, Tehama, Butte, Glenn, Colusa, Sutter, Yuba, Yolo, and parts of Solano and Placer Counties. The SVAB is bounded on the north by the Cascade Range, on the south by the San Joaquin Valley Air Basin, on the east by the Sierra Nevada, and on the west by the Coast Range.

5.8.1.3.2 Background Information on Air Pollutants

Air quality studies generally focus on five pollutants most commonly measured and regulated, and referred to as criteria air pollutants: ozone, CO, inhalable PM (PM10 and PM2.5), NO_2, and SO_2. Because ozone, a photochemical oxidant, is not emitted into the air directly from sources, emissions of ozone precursors, including NO_X and ROG, are regulated with the aim of reducing ozone formation in the lowermost region of the troposphere.

Ozone and NO_2 are considered regional pollutants because they (or their precursors) affect air quality on a regional scale: NO_2 reacts photochemically with ROG to form ozone, and this reaction

occurs at some distance downwind of the source of pollutants. Pollutants such as CO, PM10, and PM2.5 are considered to be local pollutants because they tend to disperse rapidly with distance from the source.

The principal characteristics surrounding these pollutants and TACs and GHGs are discussed in Section 3.6.2.2.2, Background Information on Air Pollutants.

5.8.1.3.3 Air Quality Attainment Status

The air quality attainment status for criteria pollutants in Yolo County and Sacramento County are summarized in Table 5.8-1. Areas are classified as in attainment or in non-attainment with respect to CAAQS and NAAQS. These classifications are made by comparing actual monitored air pollutant concentrations to state and Federal standards. If a pollutant concentration is lower than the state or Federal standard, the area is considered to be in attainment of the standard for that pollutant. If pollutant levels exceed a standard, the area is considered a non-attainment area. If data are insufficient to determine whether a pollutant is violating the standard, the area is designated as unclassified. This typically occurs in non-urbanized areas, where pollutant levels may be less closely monitored.

On December 22, 2008, EPA classified Yolo County as a partial non-attainment area for the PM2.5 standard. With the new designation, an attainment plan will be submitted to EPA by 2012.

Table 5.8-1. Yolo County and Sacramento County Air Quality Attainment Status

Pollutant	Averaging Time	State Standards	National Standards
Yolo County			
Ozone	1-Hour	Serious Non-attainment	No Designation
	8-Hour	Non-attainment	Serious Non-attainment
CO		Attainment	Attainment
PM10	24-Hour	Non-attainment	Unclassified
PM2.5	24-Hour	Unclassified	Partial Non-attainment
Sacramento County			
Ozone	1-Hour	Serious Non-attainment	No Designation
	8-Hour	Non-attainment	Serious Non-attainment
CO		Attainment	Attainment
PM10	24-Hour	Non-attainment	Moderate Non-attainment
PM2.5	24-Hour	Non-attainment	Unclassified/Attainment

5.8.1.3.4 Sensitive Receptors

Sensitive land uses in the vicinity of The Rivers EIP project area are primarily single-family residential, schools (e.g., Riverbank Elementary School), and public parks (e.g. Bryte Park). Single-family homes are located on Todhunter Avenue adjacent to the southwest corner of the project area, and on Rivercrest Drive and Fountain Drive adjacent to the eastern portion of the project area. Bryte Park and the playground of Riverbank Elementary School are located within 500 feet of the project area.

There are approximately 30 to 40 residences within the immediate vicinity of construction activities. At times, construction activities would be directly adjacent to their homes. As described in Chapter 2, Alternatives, WSAFCA will provide assistance for residents to relocate during construction activities and will provide compensation to residents for reasonable rent and living expenses incurred due to relocation, as the project commitments.

5.8.1.4 Climate Change Environmental Setting

The environmental setting for The Rivers EIP is described in the Program Area Affected Environment. The following provides a summary of climate change information relevant to the proposed Rivers EIP project areas.

5.8.1.4.1 Background Information on Climate Change

GHGs are any gasses that absorb infrared radiation in the atmosphere. Increases in these gasses lead to more absorption of radiation and warm the lower atmosphere further, thereby increasing evaporation rates and temperatures near the surface. Emissions of GHGs in excess of natural ambient concentrations are thought to be responsible for the global climate change. The most common GHG is CO_2, which constitutes approximately 84% of all emissions of GHG in California. GHG are global pollutants, unlike criteria air pollutants (such as ozone precursors) and TACs, which are pollutants of regional and local concern.

5.8.1.4.2 California Climate Trends

Maximum (daytime) and minimum (nighttime) temperatures are increasing almost everywhere in California but at different rates. The annual minimum temperature averaged over all of California increased 0.33°Fper decade from 1920 to 2003, while the average annual maximum temperature increased 0.1°F per decade (Moser et al. 2009). At the same time the precipitation mix between snow and rain has shifted in favor of more rainfall and less snow (Mote et al. 2005, Knowles 2006). These changes have significant implications for water supply, flooding, aquatic ecosystems, energy generation, and recreation throughout the state.

5.8.2 Air Quality Environmental Consequences

This section describes the environmental consequences relating to air quality and climate change for the proposed Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP project, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis described in Section 3.6.3.3, Effects and Mitigation Measures. Project-specific discussion is provided below the summary table if there are unique aspects to the project footprint, characteristics, or other manifestations of a program effect specific to The Rivers EIP.

5.8.2.1 Air Quality Assessment Methods

To assist in the determination of effects, various quantitative models are available to predict emissions and particulate matter generation. Two such models are URBEMIS and SacRCEM. While SacRCEM has typically been used for other recent levee improvement projects in the Sacramento

Valley, both models have been applied to simulate the project-level air quality effects of the WSLIP. Given the similarity in the architecture of the two models, for ROG, NO_X, and CO_2, the outputs from the two models are very similar and any variance is considered not statistically significant. For PM, the URBEMIS outputs are considered more conservative (meaning the production values are higher) based on the model's internal methods and assumptions for treatment of earthwork. As the project proponent, WSAFCA has selected this more conservative approach to not under-predict potential project effects. URBEMIS further allows application of mitigation measures to fine-tune and predict quantitative effectiveness of available measures and assist in determining post-mitigation findings. For these reasons, WSAFCA has selected to use the results of URBEMIS for quantitative determination of effects, effect findings, and mitigation efficacy. The results of both models for the WSLIP EIPs are in Appendix E.

Construction-related emissions were estimated using URBEMIS 2007 model (Version 9.2.4), which uses EPA, CARB, and air district emissions factors to estimate emissions from construction activities. Construction emissions (tailpipe emissions and fugitive dust) were modeled using the conceptual construction schedule, phases, and equipment usage based on the most current available project design information.

5.8.2.2 Air Quality Determination of Effects

For this analysis, an effect pertaining to air quality was analyzed based on professional practice and State CEQA Guidelines Appendix G (14 CCR 15000 *et seq*.). An effect was considered significant if it would:

- conflict with, or obstruct implementation of, the applicable air quality plan;
- violate any air quality standard or substantial contribution to existing or projected air quality violation;
- result in a cumulatively considerable net increase of any criteria pollutant for which the project region is a non-attainment area under NAAQS and CAAQS;
- expose sensitive receptors to substantial pollutant concentrations; or
- create objectionable odors affecting a substantial number of people.

The appropriate district-recommended emission thresholds as published in their respective CEQA guidance documents also apply to individual projects under their jurisdiction. An air quality effect is considered to be significant if the project's construction emissions would exceed the General Conformity thresholds. For construction and operational activities that occur in Yolo County, an air quality effect is considered to be significant if the air pollutant emissions would exceed YSAQMD's thresholds of significance as shown in Table 3.6-2 (see Section 3.6.2.1, Regulatory Setting). For portions of the construction activities that would occur in Sacramento County, an air quality effect is considered to be significant if the air pollutant emissions would exceed SMAQMD's thresholds of significance as shown in Table 3.6-3 (see Section 3.6.2.1, Regulatory Setting).

5.8.3 Air Quality Effects and Mitigation Measures

5.8.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection. Current levee operations and maintenance activities would continue, but there would be no construction-related emissions from program implementation or maintenance.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to under-seepage, slope stability, or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Air Quality program analysis (Section 3.6.3.3.1). In summary, those effects on air quality could include emission of pollutants in excess of air quality standards, increase in GHG emission, and exposure of sensitive receptors to toxic air emissions as a result of flood-fighting activities. These effects could occur for days, weeks or even months. These effects could be considered significant; however, the timing, duration, and magnitude of a flood event are speculative and unpredictable, and therefore a precise determination of significance is not possible.

5.8.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the effects on air quality as outlined in the summary table provided after construction phases and duration information on air quality. A description of these effects is provided below the summary table.

Construction phases, duration, and activities for The Rivers APA are listed in Table 5.8-2. As described in Chapter 2, Alternatives, construction of the proposed project is anticipated to take place in 2011 and would be completed during the typical construction season. For the air quality impact analysis, it is assumed that the construction work for each section would occur progressively by phases. For each construction phase, construction equipment uses at the site, exported spoils, and imported materials are provided by the project engineers and summarized in Table 5.8-2. Detailed operation hours and horsepower ratings of construction equipment used for each construction phase, and URBEMIS model results are included in the Appendix E.

Table 5.8-2. Construction Phases, Activities, Schedule, and Equipment: The Rivers APA

Phase	Duration (days)	Area (acres)	Excavated Spoils (cy)	Import Material (cy)	Construction Equipment
Flood Control Alternative					
Road demolition	2	0.6	1,000	–	6 dump trucks, 1 loader, 2 bulldozers, 1 excavator
Clearing and grubbing	6	6.9	11,200	–	18 dump trucks, 2 bulldozers, 1 excavator
Levee degrade	27	6	58,100	–	18 dump trucks, 1 bulldozer, 1 excavator
Slope flattening	7	6.9	–	11,200	14 dump trucks, 2 bulldozers, 2 excavators, 1 compactor, 1 maintainer, 1 water truck

Phase	Duration (days)	Area (acres)	Excavated Spoils (cy)	Import Material (cy)	Construction Equipment
Slurry wall construction	21	–	12,333	500	1 dump truck, 9 delivery trucks, 1 loader, 2 bulldozers, 1 long reach track hoe, 1 rough terrain forklift
DSM wall construction	44	–	–	1,000	9 delivery trucks, 1 loader, 1 crane with augers, 1 rough terrain forklift
Fill placement	31	6.9	–	92,000	22 dump trucks, 4 bulldozers, 1 excavator, 2 compactors, 1 maintainer, 1 water truck
Road construction	2	0.6	–	1,000	8 dump trucks, 1 skip loader, 1 blade, 1 sheepsfoot compactor, 1 pneumatic compactor, 1 roller compactor, 1 distributor, 1 asphalt paver, 1 water truck
Recreation Alternative					
Clear and pruning	5	1.2	–	–	1 scraper, 1 wheel loader, 1 motor grader, 1 dump truck, 1 steel wheel loader, 1 water truck
Grading	8	2.4	–	–	1 scraper, 1 wheel loader, 1 motor grader, 1 dump truck, 1 steel wheel loader, 1 water truck
Install pathways and signs	12	1.6	–	2,300	1 dump truck, 1 asphalt paver, 1 asphalt sealer, 1 striping truck, 1 small front loader, 1 skid steer loader, 1 small roller

cy = cubic yards.

Based on the construction activities described above, construction-related emissions were estimated using the URBEMIS 2007 model. It is anticipated that on-site equipment operations would generate the highest daily diesel exhaust and site earthmoving activities would result in the highest daily fugitive dust generation. The estimated construction emissions are shown in Table 5.8-3. To comply with YSAQMD, SMAQMD, and General Conformity thresholds, annual emissions are estimated for ROG, NO_X, CO, PM10, and PM2.5 and the maximum daily emission is estimated for NO_X and PM10. Detailed construction emissions for each construction phase are summarized in the Appendix E.

As described in Chapter 2, Alternatives, in order to complete the project before the flood season, the contractors would be allowed to construct on a 24/7 work schedule. Depending on the daily construction activities, the 24/7 work schedule could result in higher daily NO_X and PM10 emissions than the estimated emissions shown in Table 5.8-3, which are based on the standard construction schedule (10 hours per day and 5 days per week). The annual emissions for ROG, NO_X, CO, PM10, and PM2.5 would be the same for both the standard schedule and the 24/7 schedule because the project would be completed in 2011 under either schedule.

Table 5.8-3. Estimated Construction Emissions: The Rivers APA

Construction Emissions	ROG (tons/year)	NO_X (lbs/day)	NO_X (tons/year)	CO (tons/year)	PM10 (lbs/day)	PM10 (tons/year)	PM2.5 (tons/year)	CO2 (tons/year)
Project Construction without Mitigations								
Project-wide								
Maximum daily emissions	–	494	–	–	372	–	–	–
Total annual Emissions	1.6	–	15.4	5.7	–	12.4	3.0	1,786
Within YSAQMD								
Maximum daily emissions	–	448	–	–	370	–	–	–
Total annual Emissions	1.5	–	14	5	–	12.3	3	1,589
Within SMAQMD								
Maximum daily emissions	–	47	–	–	2	–	–	–
Total annual Emissions	0.1	–	1.4	0.7	–	0.1	0.1	197
Project Construction with Mitigations								
Project-wide								
Maximum daily emissions	–	325	–	–	46	–	–	–
Total annual emissions	1.6	–	10.1	5.7	–	2.2	0.6	1,786
Within YSAQMD								
Maximum daily emissions	–	278	–	–	44	–	–	–
Total annual Emissions	1.5	–	8.7	5	–	2.1	0.6	1,589
Within SMAQMD								
Maximum daily emissions	–	47	–	–	2	–	–	–
Total annual Emissions	0.1	–	1.4	0.7	–	0.1	0.1	197
Construction Thresholds								
Federal General Conformity (Project-wide emissions)	50	–	50	–	–	100	100	–
YSAQMD (Emissions in YSAQMD)	10		10	–	80		–	–
SMAQMD (Emissions in SMAQMD)	–	85	–	–	–	–	–	–

Effect	Finding	With Mitigation	Mitigation Measure
AQ-1: Conflict with or Obstruct an Applicable Air Quality Plan	Less than significant	N/A	N/A
AQ-2: Increase in Construction Emissions to Exceed Applicable Thresholds	Significant	Less than significant to significant and unavoidable	AQ-MM-1: Implement Measures to Reduce Exhaust Emissions of NO_X and ROG if Unmitigated Emissions Exceed NO_X and ROG Thresholds AQ-MM-2: Implement Fugitive Dust Control Plan If Unmitigated Emissions Exceed PM10 and PM2.5 Thresholds AQ-MM-3: Provide Advance Notification of Construction Schedule and 24-Hour Hotline to Residents AQ-MM-4: Pay Required Fees to the SMAQMD to Offset NO_X Emissions
AQ-3: Long-Term Operation and Maintenance Emissions of ROG, NO_X, and PM10	Less than significant	N/A	N/A
AQ-4: Exposure of Sensitive Receptors to Toxic Air Emissions	Less than significant	N/A	N/A
AQ-5: Exposure to Objectionable Odors from Diesel Exhaust	Less than significant	N/A	N/A

Effect AQ-1: Conflict with or Obstruct an Applicable Air Quality Plan

A program or project is deemed inconsistent with an air quality plan if it would result in population or employment growth that exceeds the growth estimates in the applicable air quality plan—thus generating emissions not accounted for in the applicable air quality plan emissions budget. Consequently, proposed programs need to be evaluated to determine whether they would generate population and employment growth and, if so, whether that growth would exceed the growth rate included in the relevant air quality plan.

As described in Chapter 6, Growth-Inducing and Cumulative Effects, the implementation of the program might remove an obstacle for undeveloped lands in West Sacramento and make development easier or more attractive for these lands, which might result in population growth in these areas in the long term. The City is currently in the process of updating its 1994 General Plan. It is expected that the new General Plan will include the land use changes in these areas. Additionally, the 2035 Metropolitan Transportation Plan (Sacramento Area Council of Government 2008) has included the population projection of 278,786 people for Yolo County and 87,402 people for West Sacramento, which has accounted for the land development and population growth of these areas through 2035. The air quality conformity analysis as part of the 2035 Metropolitan Transportation Plan meets the emission conformity test for the Sacramento ozone non-attainment area. Therefore, the program would not conflict with or obstruct the implementation of air quality plans. This effect would be less than significant. No mitigation is required.

Effect-AQ-2: Increase in Construction Emissions to Exceed Applicable Thresholds

Without mitigation, construction-related emissions under The Rivers APA would exceed YSAQMD's emission thresholds for NO_X and PM10 and would result in a significant effect. Mitigation measures for this effect are AQ-MM-1 to AQ-MM-3, described below. Table 5.8-3 shows the mitigated NO_X and PM10 emissions with these mitigation measures. After mitigation, the NO_X and PM10 emissions would be less than YSAQMD's significance thresholds.

The 24/7 work schedule could result in higher daily NO_X and PM10 emissions than the standard schedule, depending on the daily construction activities. The implementation of AQ-MM-2, which includes all applicable and feasible fugitive dust control measures required by YSAQMD, will reduce PM10 emissions below the YSAQMD's significance threshold. The implementation of AQ-MM-4, which includes the NO_X mitigation fee required by the SMAQMD, would reduce NO_X emissions below the SMAQMD's significance threshold.

It is possible the CHP Academy EIP could be constructed simultaneously with The Rivers EIP, Depending on whether APA or Alternative B for each project is constructed at the same time, it is possible the combined emissions from the simultaneous projects could exceed the annual average YSCAQMD threshold for NOx and/or the maximum-daily SMAQMD threshold for NO_X. In either case, mitigation measure AQ-MM-1 would be implemented. SMAQMD's requirement for NO_X offset purchases would reduce the impact in Sacramento County to less than significant. However, YSAQMD does not require purchase of offsets, so after implementation of the mitigation measure the impact of simultaneous projects could still be significant and unavoidable in Yolo County.

Mitigation Measures

Mitigation Measure AQ-MM-1: Implement Measures to Reduce Exhaust Emissions of NO_X and ROG if Unmitigated Emissions Exceed NO_X and ROG Thresholds

Unmitigated NO_X and ROG emissions from construction equipment tailpipes could potentially exceed the YSAQMD CEQA thresholds. Therefore, WSAFCA will require the construction contractor to implement feasible and reasonable measures to reduce public nuisance and tailpipe emissions from diesel-powered construction equipment. This requirement will be incorporated into the construction contracts.

Depending on the exceedance amounts of NO_X and ROG emissions, the WSAFCA will require the construction contractor to implement either or both of the following mitigation options.

Mitigation Measure AQ-MM-1a

According to the YSAQMD guidelines (Yolo-Solano Air Quality Management District 2007), the project lead agency is encouraged to explore and incorporate mitigation measures as technology advances and less emissive products become available at lower costs.

The measures recommended by the YSAQMD are listed below.

- Reduce use, trips, and unnecessary idling of heavy equipment. Shut down idling equipment that is not used for more than 5 consecutive minutes as required by California law.
- Maintain all construction equipment in proper tune according to manufacturer's specifications.
- Use a modern equipment fleet meeting CARB's 1996 or newer certification standard for off-road heavy-duty diesel engines.

- Install emission control devices on older equipment to reduce CO, ROG, and NO_X emissions to levels equivalent to CARB's 1996 or newer certification standard.
- Locate stationary diesel-powered equipment and haul truck staging areas as far as practicable from sensitive receptors.
- Use existing power sources (e.g., power lines) or clean fuel generators rather than conventional diesel generators, when feasible
- Substitute gasoline-powered for diesel-powered equipment when feasible.
- Use reformulated and emulsified diesel fuels where feasible.
- Use alternatively fueled construction equipment on site where feasible, such as compressed natural gas (CNG), liquefied natural gas (LNG), propane, or biodiesel.
- Use aqueous diesel fuel where feasible.
- Use CARB and/or EPA-verified particulate traps and other appropriate controls (i.e., diesel oxidation catalyst or diesel particular filters) where feasible to reduce emissions of NO_X, DPM, and other pollutants at the construction site.

Mitigation Measure AQ-MM-1b

In addition to above measures, the construction contractor could provide a plan, for approval by WSAFCA and YSAQMD, demonstrating that the heavy-duty off-road equipment to be used at the project sites, including owned, leased, and subcontractor equipment, will achieve a project-wide fleet-average reduction of 20% for NO_X and 45% for diesel particulate, compared to the most recent CARB fleet average at time of construction. A construction mitigation calculator may be downloaded from the SMAQMD web site to perform the fleet average evaluation (Sacramento Metropolitan Air Quality Management District 2009).

Mitigation Measure AQ-MM-2: Implement Fugitive Dust Control Plan if Unmitigated Emissions Exceed PM10 and PM2.5 Thresholds

The construction contractor will implement all applicable and feasible fugitive dust control measures required by YSAQMD including those listed below. This requirement will be incorporated into the construction contract.

- Post a publicly visible sign with the telephone number and person to contact regarding dust complaints. This person would respond and take corrective action within 48 hours. The phone number of YSAQMD also will be visible to ensure compliance with the YSAQMD Rule 2.5, Nuisance.
- Water active unpaved areas at all construction sites at least twice daily in dry conditions, with the frequency of watering based on the type of operation, soil, and wind exposure.
- Prohibit all grading activities and water all areas of disturbed soil under windy conditions (winds more than 20 miles per hour).
- Limit on-site vehicles to a speed that prevents visible dust emissions to extend beyond unpaved roads.
- Cover all trucks hauling dirt, sand, or loose materials.
- Cover active and inactive storage piles where appropriate.

- Cover or hydroseed unpaved areas that will remain inactive for extended periods.
- Apply soil stabilizers to active and inactive areas where appropriate.
- Install wheel washers at the entrance to construction sites for all exiting trucks.
- Sweep streets if visible soil material is carried out from the construction site.
- Install wind fencing and phase grading operations where appropriate.

Fugitive dust emissions from the construction of the project would be reduced to a less-than-significant level with the implementation of above mitigation.

Mitigation Measure AQ-MM-3: Provide Advance Notification of Construction Schedule and 24-Hour Hotline to Residents

WSAFCA will provide advance written notification of the proposed construction activities to all residences and other air quality-sensitive uses within 500 feet of the construction site. Notification will include a brief overview of the proposed project and its purpose, as well as the proposed construction activities and schedule. It will also include the name and contact information of WSAFCA's project manager or a representative for ensuring that reasonable measures are implemented to address the problem.

Mitigation Measure AQ-MM-4: Pay Required Fees to the SMAQMD to Offset NO_X Emissions

It is possible that on-road construction emissions, for vehicles traveling within the Sacramento County, could exceed the SMAQMD NO_X threshold. If on-road construction emissions exceed SMAQMD threshold levels, WSAFCA will be required to pay an offsite mitigation fee. Prior to the approval of project plans or the issuance of grading permits, the WSAFCA will submit proof that the offsite air quality mitigation fee of $16,000 per ton of NO_X has been paid to SMAQMD and that the construction air quality mitigation plan has been approved by SMAQMD and the lead agency. SMAQMD already has enacted a well-defined program to use NO_X offset fees received from applicants to fund regional NO_X emission reduction projects. Therefore, with the implementation of this mitigation, the air quality impact to SMAQMD would be reduced to a less-than-significant level.

Effect AQ-3: Long-Term Operation and Maintenance Emissions of ROG, NO_X, and PM10

After the proposed alternatives are constructed, the program facilities will be generally maintained as needed. Maintenance work would be less extensive and would take place over a few days per year. In addition, maintenance and operational activities are part of the existing environmental baseline and thus would not create a substantial source of new emissions. This effect would be less than significant.

Effect AQ-4: Exposure of Sensitive Receptors to Toxic Air Emissions

Construction of the proposed alternatives would result in short-term diesel exhaust emissions from on-site heavy duty equipment. Particulate exhaust emissions from diesel-fueled engines (DPM) were identified as a TAC by CARB in 1998. Construction of alternatives would result in the generation of DPM emissions from the use of off-road diesel equipment required for site grading and excavation, paving, and other construction activities.

The assessment of health risks associated with exposure to diesel exhaust typically is associated with chronic exposure, in which a 70-year exposure period is often assumed. However, while cancer can result from exposure periods of less than 70 years, acute exposure periods (i.e., exposure periods of 2 to 3 years) to diesel exhaust are not anticipated to result in an increased health risk, as health risks associated with exposure to diesel exhaust are typically seen in exposures periods that are chronic. Construction of the program is not expected to take place at the same construction site for more than 1 to 2 years and would be expected to use a limited number of pieces of heavy equipment at the same construction site.

Furthermore, as required by CARB regulation, no in-use off-road diesel vehicles may idle for more than 5 consecutive minutes. In addition, implementation of Mitigation Measure AQ-MM-1 would further reduce exhaust emissions during construction. With implementation of mitigation measures and best management practices, the effect would be reduced to less than significant and no further mitigation is required.

Effect AQ-5: Exposure to Objectionable Odors from Diesel Exhaust

The program implementation would not result in any major sources of odor, and the program would not involve operation of any of the common types of facilities that are known to produce odors (e.g., landfill, wastewater treatment facility). In addition, odors associated with diesel exhaust from the use of on-site construction equipment would be intermittent and temporary and would dissipate rapidly from the source with an increase in distance.

Furthermore, as required by CARB regulation, no in-use off-road diesel vehicles may idle for more than 5 consecutive minutes. Implementation of Mitigation Measures AQ-MM-1 and AQ-MM-3 would further reduce exhaust emissions during construction. This effect would be less than significant.

5.8.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the effects on air quality as outlined in the summary table provided after construction phases and duration information on air quality. A description of these effects is provided below the summary table.

Table 5.8-4 summarizes the construction phases, duration, and activities for The Rivers Alternative B. As described in Chapter 2, Alternatives, construction of the proposed project is anticipated to take place in 2011 and would be completed during the typical construction season (April 15 to November 1). Construction work would be conducted on the land side; no in-water and nearshore work is anticipated. For the air quality impact analysis, it is assumed that the construction work for each section would occur progressively by phases. For each construction phase, construction equipment uses at the site, exported spoils, and imported materials are provided by the project engineers and summarized in Table 5.8-4. Detailed operation hours and horsepower ratings of construction equipment used for each construction phase are included in Appendix E.

Table 5.8-4. Construction Phases, Activities, Schedule, and Equipment: The Rivers Alternative B

Phase	Duration (days)	Area (acres)	Excavated Spoils (cy)	Import Material (cy)	Construction Equipment
Flood Control Alternative					
Road demolition	2	0.6	1,000	–	6 dump trucks, 1 loader, 2 bulldozers, 1 excavator
Clearing and grubbing	6	6.9	11,200	–	18 dump trucks, 2 bulldozers, 1 excavator
Slope flattening	23	6.9	–	54,700	18 dump trucks, 2 bulldozers, 2 excavators, 1 compactor, 1 maintainer, 1 water truck
Sheet pile wall construction	18	–	–	200	1 long bed truck, 2 cranes, 1 impact hammer
Road construction	2	0.6	–	1,000	8 dump trucks, 1 skip loader, 1 blade, 1 sheepsfoot compactor, 1 pneumatic compactor, 1 roller compactor, 1 distributor, 1 asphalt paver, 1 water truck
Recreation Alternative					
Clear and pruning	5	1.2	–	–	1 scraper, 1 wheel loader, 1 motor grader, 1 dump truck, 1 steel wheel loader, 1 water truck
Grading	8	2.4	–	–	1 scraper, 1 wheel loader, 1 motor grader, 1 dump truck, 1 steel wheel loader, 1 water truck
Install pathways and signs	12	1.6	–	2,300	1 dump truck, 1 asphalt paver, 1 asphalt sealer, 1 striping truck, 1 small front loader, 1 skid steer loader, 1 small roller

cy = cubic yards.

Based on the construction activities described above, construction-related emissions were estimated using the URBEMIS 2007 model. The estimated construction emissions are shown in Table 5.8-5. Detailed construction emissions for each construction phase are summarized in Appendix E.

As described in Chapter 2, Alternatives, in order to complete the project before the flood season, the contractors would be allow to construct on a 24/7 work schedule. Depending on the daily construction activities, the 24/7 work schedule could result in higher daily NO_X and PM10 emissions than the estimated emissions shown in Table 5.8-5, which are based on the standard construction schedule (10 hours per day and 5 days per week). The annual emissions for ROG, NO_X, CO, PM10, and PM2.5 would be the same for both the standard schedule and the 24/7 schedule because the project would be completed in 2011 under either schedule.

Table 5.8-5. Estimated Construction Emissions: The Rivers Alternative B

Construction Emissions	ROG (tons/year)	NO_X (lbs/day)	NO_X (tons/year)	CO (tons/year)	PM10 (lbs/day)	PM10 (tons/year)	PM2.5 (tons/year)	CO2 (tons/year)

AQ-5: Exposure to Objectionable Odors from Diesel Exhaust	Less than significant	N/A	N/A

Effect AQ-1: Conflict with or Obstruct an Applicable Air Quality Plan

This effect is the same as described above under The Rivers APA. The effect is considered less than significant. No mitigation is required.

Effect AQ-2: Increase in Construction Emissions to Exceed Applicable Thresholds

Without mitigation, construction-related emissions under the proposed project may exceed YSAQMD's emission threshold for PM10 and would result in a significant effect. Mitigation measures for this effect are AQ-MM-2 and AQ-MM-3, described above under The Rivers APA. Table 5.8-5 shows the mitigated PM10 emissions with the above fugitive dust control measures. After mitigation, the controlled PM10 emissions would be less than YSAQMD's 80 pounds/day significance threshold.

The 24/7 work schedule could result in higher daily NO_X and PM10 emissions than the standard schedule, depending on the daily construction activities. The implementation of AQ-MM-2, which includes all applicable and feasible fugitive dust control measures required by YSAQMD, will reduce PM10 emissions below the YSAQMD's significance threshold. This effect would be less than significant. The implementation of AQ-MM-4, described above under The Rivers APA, which includes the NO_X mitigation fee required by the SMAQMD, would reduce NO_X emissions below the SMAQMD's significance threshold.

It is possible the CHP Academy EIP could be constructed simultaneously with The Rivers EIP. Depending on whether APA or Alternative B for each project is constructed at the same time, it is

possible the combined emissions from the simultaneous projects could exceed the annual average YSCAQMD threshold for NO_X and/or the maximum-daily SMAQMD threshold for NO_X. In either case, mitigation measure AQ-MM-1 would be implemented. SMAQMD's requirement for NO_X offset purchases would reduce the impact in Sacramento County to less than significant. However, YSAQMD does not require purchase of offsets, so after implementation of the mitigation measure the impact of simultaneous projects could still be significant and unavoidable in Yolo County.

Effect AQ-3: Long-Term Operation and Maintenance Emissions of ROG, NO_X, and PM10

This effect is the same as described above under The Rivers APA. This effect is considered less than significant. No mitigation is required.

Effect AQ-4: Exposure of Sensitive Receptors to Toxic Air Emissions

This effect is the same as described above under The Rivers APA. This effect is considered less than significant. No mitigation is required.

Effect AQ-5: Exposure to Objectionable Odors from Diesel Exhaust

This effect is the same as described above under The Rivers APA. This effect is considered less than significant. No mitigation is required.

5.8.4 Climate Change Environmental Consequences

This section describes the environmental consequences relating to climate change for The Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects described in Section3.6.3.6, Effects and Mitigation Measures.

5.8.4.1 Climate Change Assessment Methods

Almost all increased GHG emissions associated with the proposed project would be generated by construction-related activities. Therefore, the focus of the GHG analysis is to evaluate construction-related emissions. The principal source of GHG associated with would be temporary tailpipe emissions from construction equipment and haul trucks; the principal GHG produced would be CO_2. No air district in California, including YSAQMD, has formally adopted a significant threshold for analyzing GHG or CO_2 emissions generated by a proposed project or a methodology for analyzing air quality effects related to global warming. However, CARB and the major air quality agencies in the state (BAAQMD, SCAQMD, and SJVAPCD) have published draft thresholds for defining the significance of GHG emissions from construction projects and operational projects. Those draft thresholds and mitigation measures were utilized in the analysis of effects related to climate change.

To assist in the determination of effects, various quantitative models are available to predict emissions; URBEMIS and SacREM. As described in Section 3.6.3.1, Air Quality Assessment Methods,

those two models were utilized for quantitative determination of effects, effect findings, and mitigation efficacy.

5.8.4.2 Climate Change Determination of Effects

For this analysis, an effect pertaining to air quality was analyzed based on professional practice, draft NEPA Guidance published by CEQ, and State CEQA Guidelines Appendix G (14 CCR 15000 *et seq*.). An effect was considered significant if it would:

- generate GHG emission that may have a significant impact on the environment, or
- conflict with an applicable plan adopted for the purpose of reducing GHG emissions.

5.8.5 Climate Change Effects and Mitigation Measures

5.8.5.1 No Action Alternative

The No Action Alternative is the same as that described above in Section 5.8.3.1, Air Quality No Action Alternative.

5.8.5.2 The Rivers Applicant Preferred Alternative

Implementation of The River APA would result in the following effects on climate change as outlined in the summary table provided. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
CC-1: Increase in Greenhouse Gas Emissions during Construction	Less than significant	N/A	N/A
CC-2: Conflict with an Applicable Plan, Policy or Regulation Adopted for the Purpose of Reducing the Emissions of GHGs	Less than significant	N/A	N/A
CC-3: Changes in Flood Frequency and Floodwater Elevation Caused by Global Climate Change	Less than significant	N/A	N/A

Effect CC-1: Increase in Greenhouse Gas Emissions during Construction

Both SMAQMD and YSAQMD have not formally adopted GHG thresholds for projects such as The Rivers EIP. Therefore, a presumptive threshold of 7,000 metric tons (the lowest threshold of any formally adopted GHG threshold) is compared against the CO_2 emissions for The Rivers APA. As noted in Table 5.8-3, the CO_2 emissions project-wide without mitigation would be 1,786 metric tons per year. Within YSAQMD and SMAQMD, respectively, CO_2 emissions without mitigation would be 1,589 and 197 metric tons per year. These emissions are well below the presumptive threshold and the effects of GHG emissions during construction are considered less than significant.

Effect CC-2: Conflict with an Applicable Plan, Policy or Regulation Adopted for the Purpose of Reducing the Emissions of Greenhouse Gases

The Rivers APA does not pose any apparent conflict with the goals of AB 32, the key elements and GHG reduction measures in the Climate Change Scoping Plan, or any other plans for reduction or mitigation of GHGs. To date, no federal, state, or local agency with jurisdiction over the proposed project has adopted plans or regulations that set specific goals for emission limits or emission reductions applicable to the proposed levee improvement project. As described in Effect CC-1, the average forecast emissions from the implementation of the proposed project were compared to conservatively low presumptive significance thresholds that were derived from the draft GHG guidelines published by several local air quality agencies. The forecast emission rates are well below the presumptive significant threshold. Therefore, the proposed project would not conflict with or obstruct the implementation of greenhouse gas emission reduction plans. This effect is less than significant.

Effect AQ-8: Changes in Flood Frequency and Floodwater Elevation Caused by Global Climate Change

Global climate change could affect the hydrology of the Sacramento River, including the frequency of future flood events and the intensity of future flood events. As described in Section 3.2, Flood Control and Geomorphology, Projections of Future Mean Sea Level Change (p.3.2-51), the entire WSLIP program area (including the Sacramento River in the area of the Rivers project) is relatively insensitive to the projected changes in sea level rise. This effect is less than significant.

5.8.5.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on climate change. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
CC-1: Increase in Greenhouse Gas Emissions during Construction	Less than significant	N/A	N/A
CC-2: Conflict with an Applicable Plan, Policy or Regulation Adopted for the Purpose of Reducing the Emissions of GHGs	Less than significant	N/A	N/A
CC-3: Changes in Flood Frequency and Floodwater Elevation Caused by Global Climate Change	Less than significant	N/A	N/A

Effect CC-1: Increase in Greenhouse Gas Emissions during Construction

Both SMAQMD and YSAQMD have not formally adopted GHG thresholds for projects such as The Rivers EIP. Therefore, a presumptive threshold of 7,000 metric tons (the lowest threshold of any formally adopted GHG threshold) is compared against the CO_2 emissions for The Rivers APA. As noted in Table 5.8-5, the CO_2 emissions project-wide without mitigation would be 702 metric tons per year. Within YSAQMD and SMAQMD, respectively, CO_2 emissions without mitigation would be 619 and 84 metric tons per year. These emissions are well below the

presumptive threshold and the effects of GHG emissions during construction are considered less than significant.

Effect CC-2: Conflict with an Applicable Plan, Policy or Regulation Adopted for the Purpose of Reducing the Emissions of Greenhouse Gases

This effect is the same as described above under The Rivers APA. This effect is considered less than significant. No mitigation is required.

Effect CC-3: Changes in Flood Frequency and Floodwater Elevation Caused by Global Climate Change

This effect is the same as described above under The Rivers APA. This effect is considered less than significant. No mitigation is required.

Section 5.9
Noise—
The Rivers Early Implementation Project

5.9.1 Affected Environment

This section describes the affected environment for noise in The Rivers EIP project area, including the regulatory and environmental settings.

5.9.1.1 Regulatory Setting

5.9.1.1.1 State

There are no state policies related to noise that would apply to the implementation of The Rivers EIP. However, the *General Plan Guidelines* published by the Governor's Office of Planning and Research (2003) include recommendations for maximum noise exposure based on type of land use. These recommendations are available for counties and cities to adopt as part of their state-mandated requirement in establishing policies and standards in their general plans regarding incompatibilities between land uses as they relate to noise exposure.

There are no applicable Federal, state, or local quantitatively-defined regulations relating to vibration resulting from construction activities. Thresholds for annoyance and structural damage reported by Caltrans (2004) are used in this analysis. Please see the program information in Section 3.7.2.2, Regulatory Setting, for a more complete description of these thresholds.

5.9.1.1.2 Local

The following local policies related to noise may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.7.2.2, Regulatory Setting, for a more complete description of each policy.

- City of West Sacramento Noise Ordinance
- City of Sacramento Noise Ordinance
- *City of West Sacramento General Plan*
- *Yolo County General Plan*
- *City of Sacramento General Plan*

5.9.1.2 Environmental Setting

The environmental setting for The Rivers EIP is described in the Program Area Affected Environment. This section presents additional setting information specifically related to noise for The Rivers EIP project area.

Noise-sensitive land uses in the study area are primarily residential uses and schools. The following project-specific noise-sensitive receivers were used for this analysis:

- Waterfront homes across in river in the City of Sacramento, roughly 900 to 1,000 feet from the top of the levee.
- The Rivers housing development (in the City of West Sacramento) consisting of and single-family residences located west of the intersection of Riverbank Road and Todhunter Avenue. The closest dwellings are roughly 200 feet from the western terminus of the levee reach.
- Bryte Elementary School and Riverbank Elementary School (in the City of West Sacramento), with the closest classrooms roughly 450 feet from the levee reach. The City of West Sacramento noise ordinance sets a limit on indoor noise levels at schools caused by non-transportation noise sources, so the indoor classrooms were included as noise sensitive receivers. However, outdoor parks and recreation areas are not included as protected areas under the City of West Sacramento noise ordinance, and the ordinance does not list an allowable exterior noise level for schools. Therefore, the outdoor recreational facilities at the schools were not considered noise sensitive receivers for this analysis.
- Single-family homes on the south side of Riverbank Road and Fountain Drive (in the City of West Sacramento), roughly 150 feet from the top of the levee.
- Single-family homes on the north side of Rivercrest Drive (in the City of West Sacramento), roughly 50 feet from the centerline of the levee crest.

Bryte Park includes outdoor baseball fields, a soccer fields, and swimming pools within 200 feet of the levee reach. However, outdoor parks and recreation areas are not included as protected areas under the City of West Sacramento noise ordinance. Therefore, the outdoor recreational facilities at Bryte Park were not considered noise sensitive receivers for this analysis.

Primary noise sources in the project vicinity include vehicular traffic on local roadways and I-80. Secondary noise sources include boating traffic on the Sacramento River, schoolyard activities at Riverbank Elementary/Bryte Elementary, and airplane flyovers (to and from regional airports and facilities).

5.9.1.2.1 Ambient Noise Survey

An ambient noise survey was conducted by ICF Jones & Stokes on Thursday, February 5, 2009, to characterize the existing ambient noise environment in the study area. Short-term attended measurements were made at two locations using a Larson Davis 812 Type I integrating sound level meter (SLM). The SLM was calibrated before and after ambient measurements using a Larson Davis CAL200. The microphone of the meter was situated at a height of 5 feet above the ground during both measurements, which were conducted for a continuous duration of at least 10 minutes. The SLM was set to "slow" time response and A-weighting (dBA). Meteorological conditions were mild during short-term noise measurements, with measured temperatures between 60 and 63° F and measured wind speeds from 1 to 4 miles per hour. Accordingly, meteorological conditions were suitable for noise measurements (i.e., there were no conditions such as high wind that would distort the measurement data).

The first short-term measurement (ST1) was located adjacent to the northern Bryte Elementary/Riverbank Elementary School parking lot on the east end of Riverbank Road. Noise sources included schoolyard activity, distant highway traffic and a small plane flyover. The second short-term measurement (ST2) was located at the intersection of Riverbank Road and Todhunter

Avenue. Noise sources included local vehicular traffic, distant highway traffic and birds. The results of the ambient noise survey are summarized in Table 5.9-1.

Table 5.9-1. Ambient Noise Survey Results, The Rivers EIP Project Area

Location	Start Time	L_{eq}	L_{max}
ST1 (Riverbank Elementary School)	1:41 p.m.	51	66
ST2 (Todhunter Avenue)	2:04 p.m.	54	70
Note: All noise levels reported in terms of dBA. February 2009.			

5.9.2 Environmental Consequences

This section describes the environmental consequences relating to noise for the proposed Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP project, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects described in Section 3.7.3.3, Effects and Mitigation Measures.

5.9.2.1 Assessment Methods

This analysis focuses on the potential construction-related and operational noise effects associated with The Rivers EIP. Methods recommended by the Federal Transit Administration (2006) have been used to assess construction noise. Potential noise effects associated with construction activities have been evaluated by assuming the simultaneous operation of multiple pieces of heavy equipment as a reasonable upper bound for noise effects.

5.9.2.2 Determination of Effects

Determination of effects for noise and vibration for The Rivers EIP is the same as under the Program Area Environmental Consequences. The noise sensitive receivers considered for this analysis are in two separate cities, each of which has enacted its own noise ordinance. The daytime and nighttime noise ordinance limits for each city were applied as significance criteria for the noise sensitive in that city, even though all of the construction activity would be conducted within the City of West Sacramento. It is possible that construction activity for levee improvements might have to be conducted at night to respond to expedited schedule requirements. Therefore, the noise analyses described in this section assumes the project must comply with both the daytime and nighttime noise ordinance limits for the two local jurisdictions.

The Rivers EIP does not propose to introduce any new noise- sensitive uses where people would reside or work. Therefore, the effects of noise from public or private airports are not discussed further.

There are no significant sources of groundborne vibration associated with long-term operation of the proposed project after construction is completed. Therefore, operation of the proposed project would have no impact related to the exposure of persons to, or generation of excessive groundborne

vibration or groundborne noise levels and evaluation of this impact is not applicable, and is not discussed further.

5.9.3 Effects and Mitigation Measures

5.9.3.1 No Action Alternative

The No Action Alternative represents the continuation of the existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection. Current levee operations and maintenance activities would continue, but there would be no noise or vibration associated with new construction or operational activities.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to under-seepage, slope stability, or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Noise program analysis (Section 3.7.3.3.1). In summary, those effects could include excessive noise and vibration levels for extended periods of time due to flood-fighting and cleanup efforts. However, the timing, duration and magnitude of a flood event are speculative and unpredictable, and therefore a precise determination of significance is not possible.

5.9.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following noise-related effects. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
NZ-1: Exposure of Sensitive Receptors to Temporary Construction-Related Noise	Less than significant	N/A	N/A
NZ-3: Exposure of Sensitive Receptors to Intermittent Noise as a Result of Ongoing Maintenance Activities and Permanent Facility Operations	Less than significant	N/A	N/A
NZ-5: Exposure of Sensitive Receptors to Temporary Construction-Related Vibration	Significant	Significant and unavoidable	NZ-MM-4: Employ Measures to Prevent Buildings and Structures from Exposure to Excessive Groundborne Vibration

Effect NZ-1: Exposure of Sensitive Receptors to Temporary Construction-Related Noise

The Rivers APA would construct cutoff walls using the standard slurry trench method along the western half of the reach and using deep soil mixing along the eastern half of the reach. The Rivers APA would also implement slope flattening. The staging area would be on the north side of the

existing levee, so homes on the south side of the levee would be shielded from staging area noise. Construction equipment on top of the levee would be visible and audible from homes throughout the study area.

Table 5.9-2 lists the construction noise levels at each representative noise sensitive receiver during each of the major stages of The Rivers APA construction, for the condition when the construction activity is closest to the receiver. That table compares the construction noise levels to the daytime and nighttime noise ordinance limits that are used to define significance. Spatial trends in noise levels caused by each category of construction activity, which were used to derive the values in Table 5.9-2, are provided in the Program Environmental Consequences section.

Table 5.9-2. Modeled Construction Noise Levels for The Rivers Applicant Preferred Alternative

Noise Sensitive Receiver	Closest Distance to Noise Source (feet)	Modeled Noise Level (dBA)		Daytime Noise Ordinance Limit (dBA)[1]		Nighttime Noise Ordinance Limit (dBA)[1]	
		L_{max}	L_{eq}	L_{max}	L_{eq}	L_{max}	L_{eq}
Combined Slurry Cutoff Wall (Western Segment) and Staging/Mixing Area							
City of Sacramento Homes	1,100	52	48	75	59	70	54
Todhunter Ave. neighborhood	200	71	66	**70**	**50**	**65**	**45**
Riverbank Elementary School Classrooms (Indoor levels, see Note 2)	450	42	37	No Std.	45 (Indoors)	No Std.	45 (Indoors)
Fountain Drive Homes	150	75	70	**70**	**50**	**65**	**45**
Rivercrest Drive Homes	800	55	50	70	50	65	45
Combined Deep Soil Mixing (Eastern Segment) and Staging/Mixing Area							
City of Sacramento Homes	950	58	51	75	59	70	54
Todhunter Ave. neighborhood	2,400	47	41	70	50	65	45
Riverbank Elementary School Classrooms (Indoor levels)	900	39	32	No Std.	45 (Indoors)	No Std.	45 (Indoors)
Fountain Drive Homes	150	88	81	**70**	**50**	**65**	**45**
Rivercrest Drive Homes	50	92	85	**70**	**50**	**65**	**45**
Landside Levee Flattening							
City of Sacramento Homes	1,200	41	36	75	59	70	54
Todhunter Ave. neighborhood	150	76	71	**70**	**50**	**65**	**45**
Riverbank Elementary School Classrooms (Indoor levels)	400	43	38	No Std.	45 (Indoors)	No Std.	45 (Indoors)
Fountain Drive Homes	100	79	74	**70**	**50**	**65**	**45**
Rivercrest Drive Homes	100	79	74	**70**	**50**	**65**	**45**

[1] Bolded/underlined values indicate the noise ordinance limit is exceeded at the listed receiver.

[2] Indoor noise levels were estimated assuming the classroom windows are closed, which provides an assumed 20 dBA reduction compared to exterior noise levels (Federal Highway Administration 1995).

Key conclusions based on the modeling results in Table 5.9-2 are as follows:

- Construction of The Rivers APA would not cause noise levels at the waterfront homes in the City of Sacramento to exceed that City's nighttime noise ordinance limit. Therefore, impacts across the river would be less than significant even if nighttime construction is required.

- Indoor noise levels at Riverbank Elementary School would not exceed noise ordinance limits during the loudest construction activity.
- Construction noise would exceed the nighttime noise ordinance limit at the homes west of Todhunter Avenue only for brief periods when slurry cutoff wall construction or slope flattening is done along the western half of the reach.
- Both the daytime and nighttime noise ordinance limits would be exceeded for extended periods while levee improvements are done along the eastern half of the levee reach, near the Fountain Drive homes and the Rivercrest Drive homes.

As described in Environmental Commitments, Sections 2.9.1.5 and 2.9.1.5 (Noise-Reducing Construction Practices and Provide for Temporary Resident Relocation, respectively), the City has committed to implement BMPs to ensure that noise during construction does not cause significant effects at nearby homes. The contractor will obtain a temporary construction noise variance from the City, including all requirements for environmental review and public notification and comment. In this case, the contractor will implement aggressive noise reduction measures. The contractor will conduct community noise monitoring, and the City will provide assistance and compensation for residents to temporarily relocate if construction noise levels exceed noise ordinance limits. Based on these project-specific commitments, it is concluded that although construction noise would exceed noise ordinance limits, the effects of the high noise levels would be less than significant.

Similarly, construction-related haul trucks and commute vehicles traveling along public streets are not expected to cause 24-hour day-night (L_{dn}) noise levels exceeding the City's noise limits for transportation noise sources. The highest truck traffic volumes along residential streets would occur along the two-block segment of 5th Street (between A Street and C Street), where there are single-family and multi-family dwellings along the road. As described in Section 5.7, Transportation and Navigation, temporary construction activity could generate up to 296 haul truck trips per day and 72 worker commute trips per day. If the haul trucks and commute vehicles were used 24 hours per day, the project-related traffic noise level at the existing dwellings along 5th Street would be 61 dBA-L_{dn}. That project-related L_{dn} noise level is less than the 65 dBA-L_{dn} limit set by the City's noise ordinance. If haul trucks usage could be restricted to daytime hours, then the resulting L_{dn} noise levels would be lower. Therefore, this impact would be less than significant. No mitigation is required.

Effect NZ-3: Exposure of Sensitive Receptors to Intermittent Noise Due to Ongoing Maintenance Activities and Permanent Facility Operations

There would be no additional ongoing flood control-related levee maintenance activities beyond what is currently undertaken to control vegetation. Recreation trail maintenance would include sweeping, pavement repair, removal of obstacles, and periodic asphalt overlays. These maintenance activities would not have a significant effect on noise or vibration. Levee patrol roads (where permanent bike/paths and trails would be installed) are currently used for biking and walking and noise levels as a result of the use of improved paths would likely be similar to existing conditions. Therefore, this effect would be considered less than significant. No mitigation is required.

Effect NZ-5: Exposure of Sensitive Receptors to Temporary Construction-Related Vibration

The operation of heavy equipment may generate groundborne vibration that could be perceptible at residences or other sensitive land uses close to construction activity. Based on vibration reference levels from Federal Transit Administration (2006), vibration from construction activity would attenuate to less than 0.1 in/sec ppv within about 50 feet under typical conditions. Because sensitive receptors in The Rivers residential community would potentially be located within this distance, this effect is considered to be potentially significant. Implementation of Mitigation Measure NZ-MM-4 would reduce this effect, but not to a level that would be less than significant.

Mitigation

Mitigation Measure NZ-MM-4: Employ Measures to Prevent Exposure of Buildings and Structures to Excessive Groundborne Vibration

WSAFCA or its contractor will, to the extent feasible, maintain a minimum distance of 50 feet between construction equipment and occupied or vibration-sensitive buildings or structures. For cases where this is not feasible, the resident or property owner will be notified in writing prior to construction activity, and where necessary, relocated to temporary housing for the duration of construction activity. WSAFCA will inspect the interior walls of those homes prior to construction to inventory existing cracks in paint and plaster and will retain a qualified acoustical consultant or engineering firm to conduct vibration monitoring at that building to measure the actual vibration levels during construction. Following completion of construction, WSAFCA will conduct a second inspection to inventory new damage to paint and plaster, if any, that occurred as a result of construction-induced vibration. If new damage is found, then WSAFCA will promptly arrange to have the damaged repaired, or will reimburse the property owner for appropriate repairs.

In addition, if construction activity is required within 100 feet of residences or other vibration-sensitive buildings, a designated complaint coordinator will be responsible for handling and responding to any complaints received during such periods of construction. A reporting program will be required that documents complaints received, actions taken, and the effectiveness of these actions in resolving disputes.

5.9.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following noise-related effects. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
NZ-1: Exposure of Sensitive Receptors to Temporary Construction-Related Noise	Less than significant	N/A	N/A
NZ-2: Exposure of Sensitive Receptors to Temporary Vibration Caused by Pile Driving	Significant	Less than significant	NZ-MM-1: Limit Pile-Driving Vibration and Implement a Pile-Driving Vibration Control Plan
NZ-3: Exposure of Sensitive Receptors to Intermittent Noise as a Result of Ongoing Maintenance Activities and Permanent Facility Operations	Less than significant	N/A	N/A

Effect	Finding	With Mitigation	Mitigation Measure
NZ-5: Exposure of Sensitive Receptors to Temporary Construction-Related Vibration	Significant	Significant and unavoidable	NZ-MM-4: Employ Measures to Prevent Exposure of Buildings and Structures to Excessive Groundborne Vibration

Effect NZ-1: Exposure of Sensitive Receptors to Temporary Construction-Related Noise

The Rivers Alternative B would construct a sheet pile cutoff wall into the top of the levee along the entire levee reach. The Rivers Alternative B would also implement slope flattening. The staging area would be on the north side of the existing levee, so homes on the south side of the levee would be shielded from staging area noise. Construction equipment on top of the levee would be visible and audible from homes throughout the study area.

Table 5.9-3 lists the construction noise levels at each representative noise sensitive receiver during each of the major stages of The Rivers Alternative B construction, for the condition when the construction activity is closest to the receiver. That table compares the construction noise levels to the daytime and nighttime noise ordinance limits that are used to define significance. Spatial trends in noise levels caused by each category of construction activity, which were used to derive the values in Table 5.9-3, are provided in the Program Environmental Consequences section.

Table 5.9-3. Modeled Construction Noise Levels for The Rivers Alternative B

Noise Sensitive Receiver	Closest Distance to Noise Source (feet)	Modeled Noise Level (dBA)		Daytime Noise Ordinance Limit (dBA)[1]		Nighttime Noise Ordinance Limit (dBA)[1]	
		L_{max}	L_{eq}	L_{max}	L_{eq}	L_{max}	L_{eq}
Sheet Pile Driving and Staging/Mixing Area							
City of Sacramento Homes	1,100	66	59	75	59	70	54
Todhunter Ave. neighborhood	200	85	78	70	50	65	45
Riverbank Elementary School Classrooms (Indoor levels)	450	55	48	No Std.	**45 (Indoors)**	No Std.	**45 (Indoors)**
Fountain Drive Homes	150	85	78	**70**	**50**	**65**	**45**
Rivercrest Drive Homes	50	101	94	**70**	**50**	**65**	**45**
Landside Levee Flattening							
City of Sacramento Homes	1,200	41	36	75	59	70	54
Todhunter Ave. neighborhood	150	76	71	**70**	**50**	**65**	**45**
Riverbank Elementary School Classrooms (Indoor levels)	400	43	38	No Std.	45 (Indoors)	No Std.	45 (Indoors)
Fountain Drive Homes	100	79	74	**70**	**50**	**65**	**45**
Rivercrest Drive Homes	100	79	74	**70**	**50**	**65**	**45**

Noise Sensitive Receiver	Closest Distance to Noise Source (feet)	Modeled Noise Level (dBA)		Daytime Noise Ordinance Limit (dBA)[1]		Nighttime Noise Ordinance Limit (dBA)[1]	
		L_{max}	L_{eq}	L_{max}	L_{eq}	L_{max}	L_{eq}

[1] Bolded/underlined values indicate the noise ordinance limit is exceeded at the listed receiver.

[2] Indoor noise levels were estimated assuming the classroom windows are closed, which provides an assumed 20 dBA reduction compared to exterior noise levels (Federal Highway Administration 1995).

The conclusions based on the noise results shown in Table 5.9-3 are as follows:

- Sheet pile driving would not cause noise levels at homes across the river in the City of Sacramento to exceed the nighttime noise ordinance limits. Therefore, noise impacts at that location would be less than significant.
- Sheet pile driving would cause indoor noise levels inside classrooms at Riverbank Elementary School to exceed the City's noise ordinance limit, assuming the classroom windows are closed and the windows provide a nominal 20 dBA reduction compared to exterior levels.
- Sheet pile driving would cause exceptionally high noise levels at homes along Riverbank Road, Rivercrest Drive, and Fountain Drive.
- Noise levels during levee slope flattening would be much lower than the noise that would occur during sheet pile driving. However, this activity would cause noise to exceed daytime and nighttime noise ordinance limits when the construction was done within roughly 1,500 feet of a dwelling.

The construction noise levels at homes and school classrooms would be addressed by the project-level environmental commitments described in Section 2.9.1. Those commitments include temporarily relocating residents, if construction noise levels exceed noise ordinance limits. In addition, the City would commit to installing acoustical insulation in noise-affected classrooms at Bryte Elementary School and Riverbank Elementary School. Therefore, even though construction noise levels would exceed the City noise ordinance limits, the high noise levels would not be considered significant. No mitigation is required.

Similar to the The Rivers APA, haul trucks and worker commute vehicles traveling along public streets would not cause project-related traffic noise to exceed the City's noise ordinance limits, even if haul trucks were used 24 hours per day. Forecast traffic noise levels for The Rivers APA are less than the City noise ordinance limit, and Alternative B would generate lower traffic volumes than the APA. Therefore, traffic noise generated by Alternative B would also be less than the City noise ordinance limit, and would not be considered significant. No mitigation is required.

Effect NZ-2: Exposure of Sensitive Receptors to Temporary Construction-Related Vibration

The Rivers Alternative B would include installation of a sheet pile cutoff wall along the top of the levee. Some existing homes are within 50 feet of the possible alignment from the sheet pile wall. The specific type of pile driver to be used has not been determined. Therefore, for this assessment it was assumed an impact pile driver would be used, because that type of equipment would generate the highest vibration levels.

Sheet piles would be driven into the top of the levee, which is constructed of compacted, fine-grained embankment material. Based on that soil type, the source vibration level for an impact pile driver is estimated to be 0.644 inch/sec ppv, the typical value cited by the Federal Transit Administration (2006). Table 5.9-4 shows the estimated ground vibration levels that would occur at various distances from the pile driver. A ppv vibration level of 0.20 inch/sec, which is the level that might cause cracking of interior walls made of plaster, would occur 60 feet from the pile driver. The ppv level of 0.10 inch/sec, which is the level described as "strongly discernible," would occur 90 feet from the pile driver. Therefore, this assessment concludes that a ground vibration impact might occur at homes within 100 feet of the pile driver.

Because sensitive receptors in The Rivers residential community would potentially be located within this 100-foot distance, this effect is considered significant. Implementation of Mitigation Measure NZ-MM-1 would reduce this effect to a less-than-significant level.

Table 5.9-4. Estimated Ground Vibration Levels Caused by Impact Pile Driver

Distance from Construction Equipment (feet)	Ground Vibration PPV (inches/second)
25	0.64
50	0.23
60	0.20 Potential damage to interior plaster walls
90	0.10 "Strongly discernible" impact criterion
100	0.080
150	0.044

Based on Federal Transit Administration 2006 and California Department of Transportation 2004. Assumes a single impact pile driver installing sheet piles, with a source vibration level (PPV) of 0.644 inches/second at a reference distance of 25 feet.

Mitigation

Mitigation Measure NZ-MM-1: Limit Pile-Driving Vibration and Implement a Pile-Driving Vibration Control Plan

WSAFCA will employ vibration-reducing construction practices such that pile driving vibration does not exceed 0.2 inch per second at any adjacent structure. WSAFCA will prepare a vibration control plan that will identify feasible measures that will be employed to reduce construction vibration where necessary. These measures may include but are not limited to:

- maximizing the distance between pile driving and structures;
- employing resilient pile caps to reduce vibration amplitude; and
- employing alternative driving methods such as vibratory driving to reduce vibration.
- If the above reduction measures are not feasible at any given location, then WSAFCA will inspect the structure before pile driving begins, conduct vibration monitoring during pile driving, and inspect the structure again after completion of pile driving. WSAFCA will promptly take corrective measures to repair identified damages caused by the pile driving.

Effect NZ-3: Exposure of Sensitive Receptors to Intermittent Noise as a Result of Ongoing Maintenance Activities and Permanent Facility Operations

There would be no additional ongoing flood control-related levee maintenance activities beyond what is currently undertaken to control vegetation. Recreation trail maintenance would include sweeping, pavement repair, removal of obstacles, and periodic asphalt overlays. These maintenance activities would not have a significant effect on noise or vibration. Levee patrol roads (where permanent bike/paths and trails would be installed) are currently used for biking and walking and noise levels as a result of the use of improved paths would likely be similar to existing conditions. Therefore, this effect would be considered less than significant. No mitigation is required.

Effect NZ-5: Exposure of Sensitive Receptors to Temporary Construction-Related Vibration

The operation of heavy equipment other than pile-drivers may generate groundborne vibration that could be perceptible at residences or other sensitive land uses close to construction activity. Based on vibration reference levels from Federal Transit Administration (2006), vibration from construction activity would attenuate to less than 0.1 in/sec ppv within about 50 feet under typical conditions. Because sensitive receptors in The Rivers residential community would potentially be located within this distance, this effect is considered significant. Implementation of Mitigation Measure NZ-MM-4 (as described above under The Rivers APA) would reduce this effect, but not to a less-than-significant level.

Section 5.10
Vegetation and Wetlands—The Rivers Early Implementation Project

5.10.1 Affected Environment

This section describes the affected environment for vegetation and wetlands, the effects on vegetation and wetlands that would result from the No Action, APA, and Alternative B; and the mitigation measures that would reduce these effects.

The key sources of data and information used in the preparation of this section are listed and briefly described below.

- a CNDDB records search of the USGS 7.5-minute Grays Bend, Taylor Monument, Rio Linda, Davis, Sacramento West, Sacramento East, Saxon, Clarksburg, and Florin quadrangles (California Natural Diversity Database 2009b);
- the USFWS list of endangered, threatened, and proposed species for the USGS 7.5-minute Sacramento West quadrangle and Yolo County obtained from the USFWS web site (U.S. Fish and Wildlife Service 2009b);
- the CNPS 2009 online *Inventory of Rare and Endangered Plants of California* (California Native Plant Society 2009b);
- the CDFA's Pest Ratings of Noxious Weed Species and Noxious Weed Seed (California Department of Food and Agriculture 2009);
- the Cal-IPC's California Invasive Plant Inventory (California Invasive Plant Council 2006, 2007); and
- City of West Sacramento General Plan Policy Document (City of West Sacramento 2004).

5.10.1.1 Regulatory Setting

5.10.1.1.1 Federal

The following Federal policies related to vegetation and wetlands may apply to implementation of The Rivers EIP. Please see Section 3.8.2.1, Regulatory Setting, for a more complete description of each policy.

- Endangered Species Act
- Clean Water Act
- Rivers and Harbors Act
- Executive Order 11990: Protection of Wetlands
- Executive Order 13112: Invasive Species

5.10.1.1.2 State

The following state policies related to vegetation and wetlands may apply to implementation of The Rivers EIP. Please see Section 3.8.2.1, Regulatory Setting, for a more complete description of each policy.

- California Endangered Species Act
- California Native Plant Protection Act
- California Fish and Game Code
- Porter-Cologne Water Quality Control Act

5.10.1.1.3 Local

The following local policies related to vegetation and wetlands may apply to implementation of The Rivers EIP. Please see Section 3.8.2.1, Regulatory Setting, for a more complete description of each policy.

- *Yolo County General Plan*
- *Yolo County Oak Woodland Conservation and Enhancement Plan*
- *City of West Sacramento General Plan*
- *City of West Sacramento Tree Preservation Ordinance*

5.10.1.2 Environmental Setting

This section discusses the environmental setting related to vegetation and wetlands in the project study area for The Rivers EIP, including the methods used to evaluate vegetation and wetland conditions, a description of existing land cover types in the study area, identification of waters of the United States (including wetlands), and discussions of the special-status plants that are known to occur in the project region, native tree resources, and invasive plant species.

5.10.1.2.1 Study Area

For the purposes of this section, The Rivers EIP study area consists of the project disturbance footprint plus an additional 100-foot-wide buffer zone to support an assessment of potential indirect effects. The width of the buffer zone was selected to account for indirect effects on elderberry shrubs (*Sambucus mexicana*) that are the host plant for the federally threatened valley elderberry longhorn beetle (VELB), which is discussed in Section 3.10, Wildlife. Areas designated for site access and construction staging are included in the project disturbance footprint. The study area occurs within the Great Central Valley subdivision of the California Floristic Province in Yolo County (Hickman 1993: 44, 45) and encompasses a portion of the Sacramento River North Levee. The majority of the study area consists of the levee itself, which has a broad, flat crown and is sloped on the landside only. The study area is bounded on the north by non-native annual grassland and riparian habitat and on the other three sides by developed and landscaped areas that include commercial development, residential development, Bryte Park, and Riverbank Elementary School. The topography of the portion of the study area adjacent to the levee is relatively level and elevations in the study area range from approximately 20 to 26 feet above mean sea level.

5.10.1.2.2 Field Surveys

The methods used to identify vegetation and wetland resources in the study area consisted of a pre-field investigation, reconnaissance-level site visits, a delineation of wetlands and other waters, an arborist survey, and a botanical survey. Each of these components is described below.

Pre-Field Investigation

Prior to conducting the reconnaissance-level site visits an ICF International botanist/wetland ecologist reviewed information pertaining to vegetation and wetland resources in the project region from the sources listed below.

- a CNDDB records search of the USGS 7.5-minute Sacramento West, Sacramento East, Grays Bend, Taylor Monument, Rio Linda, Davis, Clarksburg, Saxon, and Florin quadrangles (California Natural Diversity Database 2009a);
- the USFWS list of endangered, threatened, and proposed species for the USGS 7.5-minute Sacramento West quadrangle and Yolo County obtained from the USFWS web site (U.S. Fish and Wildlife Service 2009a); and
- the CNPS's 2009 online *Inventory of Rare and Endangered Plants of California* (California Native Plant Society 2009a).

No Federal, state, or local regulatory agencies were contacted prior to conducting the pre-field investigation; however, it was not appropriate at that time because the potential for the study area to contain sensitive vegetation and wetland resources could not be completely evaluated without field observations.

Reconnaissance-Level Site Visits

The botanist/wetland ecologist conducted three reconnaissance-level site visits to evaluate existing vegetation and wetland resources in the study area. The field visits were conducted on September 19 and October 5, 2007, and January 9 and February 13, 2009. The purpose of these site visits was to:

- Identify land cover types and compare field observations with existing vegetation data.
- Evaluate whether potential habitat may be present for special-status plant species that have been identified in the project region.
- Identify potential wetlands and other waters of the United States and/or state that should be delineated during future surveys.
- Identify trees that may potentially be protected under the City of West Sacramento's Tree Preservation Ordinance.
- Identify invasive plant species present in the study area.

Delineation of Wetlands and Other Waters

An ICF International soil scientist and a botanist delineated wetlands and other waters of the United States in the study area on December 29, 2008. The delineation was conducted to identify the types and locations of wetlands and other waters that may be subject to regulation by Federal (USACE) and/or state (Central Valley RWQCB) agencies. The delineation was conducted in accordance with guidance provided in the 1987 U.S. Army Corps of Engineers Wetlands Delineation Manual (Environmental Laboratory 1987: 53–69), the Regional Supplement to the Corps of Engineers 1987 Manual: Arid West Region (U.S. Army Corps of Engineers 2008), and USACE Regulatory Guidance Letter RGL 05-05 (U.S. Army Corps of Engineers 2005). The delineation was conducted to support the submission of a preliminary jurisdictional determination to the USACE Sacramento District and to obtain wastewater discharge requirements from the Central Valley RWQCB for waters of the state.

Arborist Survey

An ICF International arborist conducted tree surveys within the project disturbance footprint on April 10, 2009. The arborist survey methods follow standard professional practices and all tree location data were collected with a global positioning system unit with sub-meter accuracy. The arborist recorded the species, number of trunks, and diameter at breast height, tree height, dripline diameter, and the health and vigor of each tree.

Botanical Survey

Two ICF International botanists conducted a botanical survey in the study area on April 30, 2009. The botanists walked meandering transects throughout the study area. All plant species observed were identified to the level necessary to determine if they were special-status plants or were plant species with unusual or significant range extensions. The list of all plants observed in the study area is included as Appendix F.

5.10.1.2.3 Land Cover Types

The study area contains three land cover types: Great Valley valley oak riparian forest, non-native annual grassland, the Sacramento River, and unvegetated/vacant/developed areas. The Great Valley valley oak riparian forest and non-native annual grassland are natural communities identified in DFG's List of California Terrestrial Natural Communities Recognized by the California Natural Diversity Database (California Department of Fish and Game 2003). Each of the land cover types is discussed below and shown in Figure 5.10-1.

Great Valley Valley Oak Riparian Forest

The Great Valley valley oak riparian forest occurs in a narrow corridor along the Sacramento River and has an overstory of mature, well-established trees (Figure 5.10-1). Approximately 8.99 acres of Great Valley valley oak riparian forest occur within the study area; however, only 2.07 acres occurs within the project disturbance footprint. Valley oak (*Quercus lobata*) is the dominant species, but Fremont cottonwood (*Populus fremontii* ssp*. fremontii*), box elder (*Acer negundo* var. *californicum*), and interior live oak (*Quercus wislizeni*) are also present. The shrub layer was predominantly Himalayan blackberry (*Rubus discolor*) and poison oak (*Toxicodendron diversilobum*). Scattered elderberry shrubs occur within and along the southern edge of the riparian forest. Riparian forest is

identified as a sensitive natural community by the California Natural Diversity Database (California Natural Diversity Database 2009b).

Non-Native Annual Grassland

The non-native annual grassland in The Rivers EIP study area occurs between the Great Valley valley oak riparian forest and the unvegetated/vacant/developed areas Indications of past and ongoing disturbance are evident (e.g., numerous dirt trails, transient camps) (Figure 5.10-1). Approximately 11.19 acres of non-native annual grassland occur within the study area and the majority of it (approximately 10.12 acres) occurs within the project disturbance footprint. Species commonly observed in the non-native annual grassland were wild oat (*Avena fatua*), ripgut brome, soft chess, rattail fescue (*Vulpia myuros* var. *myuros*), foxtail barley (*Hordeum murinum* spp. *leporinum*), and Italian ryegrass (*Lolium multiflorum*). Forb species observed in non-native annual grasslands in the study area were Mediterranean mustard, big heronbill (*Erodium botrys*), prickly lettuce (*Lactuca serriola*), horseweed (*Conyza canadensis*), and wild radish (*Raphanus* spp.).The annual grassland was very dense on the landside slope of the levee but sparser on the levee crown, where open, sandy areas were observed. The annual grasslands in the study area contain a relatively large proportion of ruderal species, likely as a result of the substantial degree of disturbance from human activities (e.g., numerous dirt trails traverse the grasslands in the northern portion of the study area).

Sacramento River

The study area contains 0.59 acre of the Sacramento River that is comprised of a small area of open water and the portion of the riverbank located below the OHWM. The Sacramento River is located outside the construction zone in the buffer zone component of the study area.

Unvegetated/Vacant/Developed

The unvegetated/vacant/developed portions of the study area consist of paved and unpaved roads, commercial development, residential development, Bryte Park, and Riverbank Elementary School and encompass approximately 25.16 acres (Figure 5.10-1). The commercial development is located in the western portion of the study area that is adjacent to the Sacramento River. The majority of the residential development is located in the southern half of the eastern portion of the study area. Riverbank Elementary School and Bryte Park are in the southern half of the western portion of the study area. Plant species observed in developed/landscaped areas were non-native ornamentals.

5.10.1.2.4 Waters of the United States, Including Wetlands

No wetlands occur within the study area. However, the study area contains 0.59 acre of the Sacramento River, which includes both areas of open water and portions of the riverbank that are located below the OHWM.

5.10.1.2.5 Special-Status Plant Species

Special-status plant species are plants that are legally protected under CESA, ESA, or other regulations, as well as species considered sufficiently rare by the scientific community to qualify for such listing. Categories of special-status plant species are described in Program Affected Environment.

Eighteen of the 34 special-status plant species identified in the Program Affected Environment were identified as occurring in the project region (California Natural Diversity Database 2009b; California Native Plant Society 2009b; U.S. Fish and Wildlife Service 2009b). The number of special-status plant species identified as having the potential to occur in the program study area differs from the number of special-status plants identified as potentially occurring in the EIP study area because the EIP study area encompasses a much smaller area. Four of the 18 species are federally and/or state-listed as endangered or threatened: palmate-bracted bird's-beak (*Cordylanthus palmatus*), Boggs Lake hedge hyssop (*Gratiola heterosepala*), Colusa grass (*Neostapfia colusana*), and Crampton's tuctoria (*Tuctoria mucronata*). The status, distribution, habitat requirements, and identification period of the 18 species are shown in Table 3.8-4 of Section 3.8, Vegetation and Wetlands. One of the species, little mousetail (*Myosurus minimus* ssp. *apus*), occurs at elevations that are at least 30 feet higher than the highest elevation within the study area. Although the Fremont cottonwood riparian forest is habitat for northern California black walnut, no protected native stands were observed during any of the site visits.

Five of the remaining 16 species occur in habitats (i.e., vernal pools, marshes) that are not present in the study area: Bogg's Lake hedge hyssop (*Gratiola heterosepala*), rose-mallow (*Hibiscus lasiocarpus*), legenere (*Legenere limosa*), Colusa grass (*Neostapfia colusana*), and Sanford's arrowhead (*Sagittaria sanfordii*). Although habitat is present in the grassland for eight of the remaining ten species, suitable microhabitat (mesic areas, adobe clay soils, alkaline soils) is not present. No mesic areas were observed during site visits and no alkaline, serpentine, or adobe clay soils have been documented in the two soil mapping units present in the study area: Lang sandy loam and Sycamore silt loam (Andrews 1972: 15, 16, 33, 34). Two special-status plant species, stinkbells (*Fritillaria agrestis*) and heartscale (*Atriplex cordulata*) were determined to have low potential to occur in the study area. No special-status plants were observed in the study area during the April 30, 2009 botanical survey that coincided with the identification periods of stinkbells and heartscale (California Native Plant Society 2009b).

The timing of the survey also coincided with the identification period of eight other special-status plant species identified during the pre-field investigation as occurring in the project region (California Native Plant Society 2009b) but for which the study area lacked suitable habitat or microhabitat. Therefore, the proposed alternatives for The Rivers EIP would not have a significant effect on special-status plants and effects on special-status plants are not discussed further. The closest special-status plant occurrence to the study area is rose-mallow that has been documented approximately 1 mile northeast of the Sacramento River North Levee (California Natural Diversity Database 2009b); however, no suitable habitat (i.e., freshwater marsh) is present in the The Rivers study area.

5.10.1.2.6 Tree Resources

Approximately 89 trees were observed in the study area during the April 2009 arborist survey and consisted of box elder, interior live oak (*Quercus wislizeni*), coast live oak (*Quercus agrifolia*), Fremont cottonwood, redwood (*Sequoia sempervirens*), plane tree (*Platanus* sp.), and miscellaneous non-native or ornamental species (e.g., cork oak [*Quercus suber*], pepper tree [*Schinus* sp.]). The results of the April 2009 arborist survey are shown in Table 5.10-1. None of the trees observed during the arborist survey met the definition of a heritage or landmark tree as defined in the City's Tree Preservation Ordinance. Therefore, the proposed project would not have a significant effect on trees protected under the City's Tree Preservation Ordinance and effects on protected trees are not discussed further.

Table 5.10-1. Arborist Survey Results for The Rivers EIP

Tree Species	Number of Individuals Observed
Box elder	19
Interior live oak	10
Chinese elm	1
Fremont cottonwood	5
Redwood	4
Plane tree	12
Valley oak	27
Other Ornamental Trees	11

5.10.1.2.7 Invasive Plant Species

Plant species that are considered invasive by the California Department of Agriculture and the California Invasive Plant Council are well-represented and fairly widespread throughout the study area (California Invasive Plant Council 2006, 2007; California Department of Agriculture 2009). Invasive plant species observed in the study area included Himalayan blackberry, yellow star-thistle, Bermuda grass, Mediterranean mustard, and ripgut brome. The California Department of Food and Agriculture and California Invasive Plant Council ratings for the invasive species observed during the site visits are provided in the plant list for the study area (Appendix F).

5.10.2 Environmental Consequences

This section describes environmental consequences relating to vegetation and wetland resources for The Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.8.3.3, Effects and Mitigation Measures.

5.10.2.1 Assessment Methods

Evaluation of the vegetation and wetland effects in this section is based on the information provided by technical maps, reports, and other documents that describe the resource conditions of the study area. This information was then compared to the type and location of proposed flood and recreation alternatives to determine whether effects would occur.

5.10.2.2 Determination of Effects

For this analysis, based on professional practice and State CEQA Guidelines Appendix G (14 CCR 15000 *et seq*.), an effect pertaining to vegetation and wetlands was considered significant if it would:

- have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by DFG or USFWS;

- have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by DFG or USFWS;
- have a substantial adverse effect on federally protected wetlands as defined by CWA Section 404 (including, but not limited to, marshes and vernal pools) through direct removal, filling, hydrological interruption, or other means;
- conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or
- conflict with the provisions of an adopted habitat conservation plan, natural communities conservation plan, or other approved local, regional, or state habitat conservation plan.

5.10.2.2.1 Effect Assumptions

The following assumptions regarding effects on vegetation and wetlands in The Rivers study area have been made for this analysis:

- No special-status plants occur in the study area and therefore effects on these species are not discussed in this section.
- No landmark or heritage trees occur in the study area and therefore effects on protected trees are not discussed in this section.
- No direct effects on elderberry shrubs would result from implementation of the project alternatives.
- All project activities, including equipment staging and access, would take place within the project disturbance footprint and noted staging areas.
- The project would comply with USACE vegetation-free policy (i.e., no vegetation is permitted within the levee's operation and maintenance zone, which includes the levee itself and an area extending 15 feet from the landside and waterside toes).
- Fill or borrow material would be obtained from a quarry or other authorized location.
- There would be effects related to the routine operation or maintenance activities under the proposed project. WSAFCA would continue with the authorized levee maintenance actions that are currently used on the Sacramento River North Levee.
- If discharge of fill into waters of the United States is associated with the proposed project, WSAFCA would require a CWA Section 404 permit from the USACE Sacramento District, and CWA Section 401 certification from the Central Valley RWQCB. Before construction begins, WSAFCA would obtain all necessary permits pertaining to affected waters of the United States. The permitting process would also require compensation for construction-, operation-, and maintenance-related effects.
- Grading would require a CWA Section 402 permit and preparation of a SWPPP.
- Grading or other construction activities would require a streambed alteration agreement from DFG.

5.10.2.2.2 Effect Mechanisms

Vegetation and wetland resources could be directly and indirectly affected by The Rivers EIP. The following types of activities could cause varying degrees of effects on these resources:

- grading, and fill placement during construction of levee alternatives;
- channel dewatering or installation of temporary water-diversion structures;
- temporary stockpiling and sidecasting of soil, construction materials, or other construction wastes;
- soil compaction, dust, and water runoff from the construction site into adjacent areas;
- introduction or spread of invasive plant species into adjacent open space areas; and
- runoff of herbicides, fertilizers, diesel fuel, gasoline, oil, raw concrete, or other toxic materials used for levee alternatives, operations, and maintenance into sensitive biological resource areas (e.g., riparian habitat, wetlands).

5.10.3 Effects and Mitigation Measures

5.10.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects on vegetation, such as disturbance of special-status plant species or wetlands would occur.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to under-seepage, slope stability, or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the programmatic Vegetation and Wetlands analysis (Section 3.8.3.3.1). In summary, these effects could include significant loss of vegetation and habitat quality due to both the hydraulic forces of the flood itself as well as the clean-up efforts. However, given the uncertainty of the occurrence or magnitude of such an event, potential effects on vegetation and waters of the United States cannot be fully quantified based on available information.

Compliance with USACE's levee vegetation guidance could result in the removal of a substantial amount of vegetation, including vegetation that comprises mature oak woodland and supports wildlife populations (including special-status species). This effect could be considered significant.

5.10.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on vegetation and wetlands. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
VEG-3: Disturbance of Removal of Riparian Vegetation as a Result of Program Construction	Significant	Less than significant	VEG-MM-1: Compensate for the Loss of Woody Riparian Habitat VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel VEG-MM-5: Install Construction Barrier Fencing to Protect Sensitive Biological Resources Adjacent to the Construction Zone VEG-MM-6: Retain a Biological Monitor VEG-MM-7: Redesign Proposed Projects to Avoid and Minimize Effects on Sensitive Biological Resources
VEG-4: Loss of Wetlands and Waters of the United States as a Result of Program Construction	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel VEG-MM-5: Install Construction Barrier Fencing to Protect Sensitive Biological Resources Adjacent to the Construction Zone VEG-MM-6: Retain a Biological Monitor
VEG-5: Disturbance or Removal of Protected Trees as a Result of Program Construction	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel VEG-MM-5: Install Construction Barrier Fencing to Protect Sensitive Biological Resources Adjacent to the Construction Zone VEG-MM-6: Retain a Biological Monitor VEG-MM-7: Redesign Proposed Projects to Avoid and Minimize Effects on Sensitive Biological Resources VEG-MM-9: Conduct a Tree Survey VEG-MM-10: Compensate for Loss of Protected Trees
VEG-6: Introduction or Spread of Invasive Plants as a Result of Program Construction	Less than significant	N/A	

Effect VEG-3: Disturbance or Removal of Riparian Habitat as a Result of Program Construction

The construction activities associated with The Rivers APA would result in the loss of 2.07 acres of Great Valley valley oak riparian forest (a sensitive natural community). These effects result from the riparian habitat being located within the project disturbance footprint (i.e., the construction zone) and compliance with the USACE policy regarding vegetation on levees. This effect is significant. Implementation of mitigation measures VEG-MM-1, VEG-MM-4, VEG-MM-5, VEG-MM-6, and VEG-MM-7, described below, would reduce this effect to a less-than-significant level.

Mitigation

Mitigation Measure VEG-MM-1: Compensate for the Loss of Woody Riparian Habitat

For direct effects on woody riparian habitat that cannot be avoided, WSAFCA will compensate for the loss of riparian habitat to ensure no net loss of habitat functions and values. Compensation ratios will be based on site-specific information and determined through coordination with the appropriate state and Federal agencies during the permitting process (e.g.,2:1=2 acres restored/created/enhanced or credits purchased for every 1 acre removed. Compensation may be a combination of off-site restoration or mitigation credits. WSAFCA will develop a restoration and monitoring plan that describes how riparian habitat will be enhanced or recreated and monitored over a minimum period of time, as determined by the appropriate state and Federal agencies.

If WSAFCA identifies on-site areas (adjacent to the levees) that are outside the USACE vegetation-free zone and chooses to compensate on site or in the project vicinity, a revegetation plan will be prepared. The revegetation plan will be developed prior to the removal of existing riparian vegetation and will be conducted on site or in the project vicinity to the extent feasible; however, mitigation site selection will avoid areas where future levee alternatives or maintenance is likely.

The revegetation plan will be prepared by a qualified restoration ecologist and reviewed by the appropriate agencies. The revegetation plan will specify the planting stock appropriate for each riparian land cover type and each mitigation site, ensuring the use of genetic stock from the project area. The plan will employ the most successful techniques available at the time of planting. Success criteria will be established as part of the plan. Plantings will be maintained for a minimum of 5 years, including weed removal, irrigation, and herbivory protection.

WSAFCA will monitor the plantings annually for 4 years, followed by monitoring every 2 years for the next 6 years to ensure that the plantings have established successfully. WSAFCA will submit annual monitoring reports of survival to the regulatory agencies issuing permits related to habitat effects, including DFG, USACE, NMFS, and USFWS. Replanting will be necessary if success criteria are not met. The riparian habitat mitigation will be considered successful when the sapling trees established meet the success criteria, the habitat no longer requires active management, and vegetation is arranged in groups that, when mature, replicate the area, natural structure, and species composition of similar riparian habitats in the region.

Mitigation Measure VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel

Before any work occurs in the project area, including grading, a qualified biologist will conduct mandatory contractor/worker awareness training for construction personnel. The awareness training will be provided to all construction personnel to brief them on the need to avoid effects on sensitive biological resources (e.g., riparian habitat, special-status species, special-status wildlife habitat) and the penalties for not complying with permit requirements. The biologist will inform all construction personnel about the life history of special-status species with potential for occurrence on site, the importance of maintaining habitat, and the terms and conditions of the biological opinion or other authorizing document. Proof of this instruction will be submitted to USFWS, DFG, or other overseeing agency, as appropriate.

The training will also cover the restrictions and guidelines that must be followed by all construction personnel to reduce or avoid effects on special-status species during project construction. The crew foreman will be responsible for ensuring that crew members adhere to the guidelines and

restrictions. Educational training will be conducted for new personnel as they are brought on the job during the construction period. General restrictions and guidelines for vegetation and wildlife that must be followed by construction personnel are listed below.

- Project-related vehicles will observe the posted speed limit on hard-surfaced roads and a 10-mile-per-hour speed limit on unpaved roads during travel in the project site.
- Project-related vehicles and construction equipment will restrict off-road travel to the designated construction area.
- All food-related trash will be disposed of in closed containers and removed from the study area at least once a week during the construction period. Construction personnel will not feed or otherwise attract fish or wildlife to the project site.
- No pets or firearms will be allowed in the project site.
- To prevent possible resource damage from hazardous materials such as motor oil or gasoline, construction personnel will not service vehicles or construction equipment outside designated staging areas.

For special-status wildlife, any worker who inadvertently injures or kills a special-status wildlife species or finds one dead, injured, or entrapped will immediately report the incident to the biological monitor. The monitor will immediately notify WSAFCA, who will provide verbal notification to the USFWS Endangered Species Office or the local DFG warden or biologist within 3 working days. WSAFCA will follow up with written notification to USFWS or DFG within 5 working days.

Mitigation Measure VEG-MM-5: Install Construction Barrier Fencing to Protect Sensitive Biological Resources Adjacent to the Construction Zone

The construction specifications will require that WSAFCA retain a qualified biologist to identify sensitive biological resources (e.g., special-status species, riparian habitat, wetlands, elderberry shrubs) adjacent to the construction zone that are to be avoided during construction. Sensitive biological resources located adjacent to the directly affected area required for construction, including staging and access, will be fenced off to avoid disturbance in these areas. If necessary, concrete barriers will also be installed to protect sensitive biological resources in areas adjacent to the directly affected area.

Before construction, the contractor will work with the project engineer and a resource specialist to identify the locations for the barrier fencing (and, if necessary, concrete barriers) and will place stakes around the sensitive biological resources to indicate their locations. The protected area will be clearly identified on the construction specifications. The fencing will be installed at least 20 feet from each sensitive biological resource and will be in place before construction activities are initiated. The fencing will be maintained by WSAFCA or its contractor throughout the duration of the construction period. If the fencing is removed, damaged, or otherwise compromised during the construction period, construction activities will cease until the fencing is replaced.

Mitigation Measure VEG-MM-6: Retain a Biological Monitor

WSAFCA will retain qualified biologists to monitor construction activities adjacent to sensitive biological resources (e.g., special-status species, riparian habitat, wetlands, elderberry shrubs). The biologists will assist the construction crew, as needed, to comply with all program implementation restrictions and guidelines. In addition, the biologists will be responsible for ensuring that the

program proponent or its contractors maintain the construction barrier fencing adjacent to sensitive biological resources.

Mitigation Measure VEG-MM-7: Redesign Proposed Projects to Avoid and Minimize Effects on Sensitive Biological Resources

WSAFCA will redesign proposed projects to avoid and minimize effects on sensitive biological resources (e.g., riparian areas outside the USACE woody vegetation-free zones, wetlands, protected trees).

Effect VEG-4: Loss of Wetlands and Waters of the United States as a Result of Program Construction

Although the portion of the Sacramento River (0.59 acre) in the study area is located outside the construction zone, ground disturbance associated with program construction could potentially result in the placement of fill materials into the Sacramento River. This effect is potentially significant because if fill materials enter the Sacramento River, the proposed project would have adverse significant effect on a water of the U.S. that is subject to USACE regulation under CWA. Implementation of mitigation measures VEG-MM-4, VEG-MM-5, and VEG-MM-6, described above, would ensure that The Rivers APA would not have an adverse significant effect on the Sacramento River.

Effect VEG-5: Disturbance or Removal of Protected Trees as a Result of Program Construction

In addition to the riparian habitat noted in Effect Veg-3, there may be some trees within the construction zone that meet the definition of heritage or landmark trees. However, they have not been formally surveyed and therefore still have the potential to be protected under the City's Tree Preservation Ordinance. If they are outside the construction zone, ground disturbance associated with the construction of levee improvements could potentially result in the disturbance of protected trees. Implementation of program mitigation measures VEG-MM-4, VEG-MM-5, VEG-MM-6, described above, and VEG-MM-7, VEG-MM-9, and VEG-MM-10, below, would ensure that the Rivers APA would not have a significant effect on trees that are potentially protected under the local ordinance.

Mitigation

Mitigation Measure VEG-MM-7: Redesign Proposed Projects to Avoid and Minimize Effects on Sensitive Biological Resources

WSAFCA will redesign proposed projects to avoid and minimize effects on sensitive biological resources (e.g., riparian areas outside the USACE woody vegetation-free zones, wetlands, protected trees).

Mitigation Measure VEG-MM-9: Conduct a Tree Survey

WSAFCA will retain a certified arborist to conduct a tree survey to identify protected trees in the study area. The arborist will document the results of the tree survey in a report that includes the location, species, size (diameter at breast height), overall health, and dripline diameter of the trees. If the arborist's survey does not identify any protected trees that would be removed or damaged as a

result of the proposed program, no additional mitigation would be necessary. If protected trees are present, WSAFCA will implement Mitigation Measure VEG-MM-10.

Mitigation Measure VEG-MM-10: Compensate for Loss of Protected Trees

WSAFCA will apply for a tree permit for the removal of any protected trees during construction. WSAFCA will replace trees that must be removed with trees at or near the location of the effect or another location within West Sacramento approved by the City's tree administrator. WSAFCA will also replace the replacement tree if it dies within 3 years of the initial planting. Replacement is not required if a tree is removed because it poses a risk, hosts a plant parasite, or is otherwise an undesirable species or specimen at the discretion of the City's tree administrator.

Replacement trees are required at a ratio of 1:1 (i.e., 1-inch diameter of replacement plant for every 1-inch diameter of tree removed). Trees may also be mitigated through payment of an in-lieu fee, which will be used to purchase and plant trees elsewhere in West Sacramento. Mitigation will be subject to approval by the City's tree administrator and may consider species affected, replacement species, location, health and vigor, habitat value, and other factors to determine fair compensation for tree loss.

Effect VEG-6: Introduction or Spread of Invasive Plants as a Result of Program Construction

Invasive plants are already present in the project area. However, construction activities associated with construction could introduce new invasive plants or contribute to the spread of existing invasive plants to un-infested areas outside the project area. Invasive plants or their seeds may be dispersed by construction equipment if appropriate prevention measures are not implemented. The introduction or spread of invasive plants as a result of the proposed project could have a significant effect on sensitive natural communities within and outside the project area by displacing native flora. The implementation of one or more of the BMPs described in the environmental commitment to avoid or minimize the spread or introduction of invasive plant species (described in detail in Section 2.9 of Chapter 2, Alternatives) will ensure that the proposed project would not have a significant effect on sensitive natural communities from the introduction or spread of invasive plants.

5.10.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on vegetation and wetlands. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
VEG-3: Disturbance of Removal of Riparian Vegetation as a Result of Program Construction	Significant	Less than significant	VEG-MM-1: Compensate for the Loss of Woody Riparian Habitat VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel VEG-MM-5: Install Construction Barrier Fencing to Protect Sensitive Biological Resources Adjacent to the Construction Zone VEG-MM-6: Retain a Biological Monitor VEG-MM-7: Redesign Proposed Projects to Avoid and Minimize Effects on Sensitive Biological Resources
VEG-4: Loss of Wetlands and Waters of the United States as a Result of Program Construction	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel VEG-MM-5: Install Construction Barrier Fencing to Protect Sensitive Biological Resources Adjacent to the Construction Zone VEG-MM-6: Retain a Biological Monitor
VEG-5: Disturbance or Removal of Protected Trees as a Result of Program Construction	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel VEG-MM-5: Install Construction Barrier Fencing to Protect Sensitive Biological Resources Adjacent to the Construction Zone VEG-MM-6: Retain a Biological Monitor VEG-MM-7: Redesign Proposed Projects to Avoid and Minimize Effects on Sensitive Biological Resources VEG-MM-9: Conduct a Tree Survey VEG-MM-10: Compensate for Loss of Protected Trees
VEG-6: Introduction or Spread of Invasive Plants as a Result of Program Construction	Less than significant	N/A	

Effect VEG-3: Disturbance or Removal of Riparian Habitat as a Result of Program Construction

The construction activities associated with The Rivers Alternative B would result in the loss of 2.07 acres of Great Valley valley oak riparian forest (a sensitive natural community). These effects result from the riparian habitat being located within the project disturbance footprint (i.e., the construction zone) and compliance with the USACE policy regarding vegetation on levees. This effect is significant. Implementation of program mitigation measures VEG-MM-1, VEG-MM-4, VEG-MM-5, VEG-MM-6, and VEG-MM-7, described above under The Rivers APA, would reduce this effect to a less-than-significant level.

Effect VEG-4: Loss of Wetlands and Waters of the United States as a Result of Program Construction

Although the portion of the Sacramento River (0.59 acre) in the study area is located outside the construction zone, ground disturbance associated with program construction could potentially result in the placement of fill materials into the Sacramento River. This effect is potentially significant because if fill materials enter the Sacramento River, the proposed project would have adverse significant effect on a water of the U.S. that is subject to USACE regulation under CWA. Implementation of program mitigation measures VEG-MM-4, VEG-MM-5, and VEG-MM-6, described above under the Rivers APA would ensure that The Rivers Alternative B would not have an adverse significant effect on the Sacramento River.

Effect VEG-5: Disturbance or Removal of Protected Trees as a Result of Program Construction

This effect is the same as that described above under The Rivers APA. The disturbance or removal of protected trees a result of project construction could have a significant effect. Implementation of program mitigation measures VEG-MM-4, VEG-MM-5, VEG-MM-6, VEG-MM-7, VEG-MM-9, and VEG-MM-10, would ensure that the Rivers Alternative B would not have a significant effect on trees that are potentially protected under the local ordinance.

Effect VEG-6: Introduction or Spread of Invasive Plants as a Result of Program Construction

This effect is the same as that described above under The Rivers APA. The introduction or spread of invasive plants as a result of the proposed project could have a significant effect on sensitive natural communities within and outside the project area by displacing native flora. The implementation of one or more of the BMPs described in the environmental commitments to avoid or minimize the spread or introduction of invasive plant species (described in detail in Section 2.9 of Chapter 2, Alternatives) will ensure that the proposed project would not have a significant effect on sensitive natural communities from the introduction or spread of invasive plants.

Section 5.11

Fisheries and Aquatic Resources—The Rivers Early Implementation Project

5.11.1 Affected Environment

This section describes the affected environment for fisheries and aquatic resources in The Rivers EIP project area, including the regulatory and environmental setting.

5.11.1.1 Regulatory Setting

5.11.1.1.1 Federal

The following Federal policies related to fisheries and aquatic resources may apply to implementation of The Rivers EIP. Please see the program information in Section 3.9.2.1, Regulatory Setting, for a more complete discussion of the relevance of these regulations to fisheries and aquatic resources.

- Endangered Species Act
- Clean Water Act
- Magnuson-Stevens Fishery Conservation and Management Act

5.11.1.1.2 State

The following state regulations or agencies would govern the implementation of The Rivers EIP. Please see Section 3.9.2.1, Regulatory Setting, for a more complete discussion.

- California Endangered Species Act
- California Fish and Game Code Section 1600: Streambed Alteration Agreements

5.11.1.1.3 Local

The following local regulations or agencies would govern the implementation of The Rivers EIP. Please see Section 3.9.2.1, Regulatory Setting, for a more complete discussion.

- *City of West Sacramento General Plan*
- *Yolo County General Plan*
- *Solano County General Plan*

5.11.1.2 Environmental Setting

5.11.1.2.1 Study Area

The Rivers EIP project area is located on the Sacramento River North Levee. The site has Great Valley oak riparian forest habitat lining the bank. The Sacramento River channel adjacent to the site

provides migratory and temporary rearing habitat for anadromous fish such as steelhead, Chinook salmon, river lamprey, and green sturgeon. Native fish, such as delta smelt and Sacramento splittail, also may spawn in the Sacramento River within the study area along shallow river margins and on adjacent floodplain habitat, when available.

5.11.2 Environmental Consequences

This section describes the environmental consequences relating to fisheries and aquatic resources for The Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.9.3.3, Effects and Mitigation Measures.

5.11.2.1 Assessment Methods

To prepare for the field surveys and analysis of the potential effects of the proposed program on fish species, fisheries biologists reviewed existing resource information related to the study area to evaluate whether sensitive habitats and special-status fish species are known from or could occur in the study area. The information reviewed included the following sources:

- a USFWS list of endangered, threatened, and proposed species for the Sacramento West, Clarksburg, Liberty Island, and Rio Vista USGS 7.5-minute quadrangle and Sacramento and Yolo Counties (U.S. Fish and Wildlife Service 2009); and
- published and unpublished documents and reports pertaining to the study area.

A reconnaissance-level survey of the study area was conducted by an ICF International fisheries biologist on October 26, 2007. During the survey, fish habitat was identified and evaluated for its ability to support special-status fish species.

The key effects were identified and evaluated based on the environmental characteristics of The Rivers EIP project area and the magnitude, intensity, and duration of activities related to the construction and operation of this project.

5.11.2.2 Determinations of Effects

For this analysis, an effect pertaining to special-status fish species and their habitats was considered adverse under NEPA or significant under CEQA if it would result in any of the following environmental effects, which are based on professional practice and CEQA Guidelines Appendix G (14 CCR 15000 *et seq.).*

Assessment species are selected based on listing under the ESA and/or CESA. An effect was considered adverse under NEPA and significant under CEQA if program actions would substantially reduce the abundance and distribution of the identified important fish species. Additionally, significant effects may occur if the project alternatives would result in:

- substantial interference with the movement of any resident or migratory fish species;
- substantial long- or short-term loss of habitat quality or quantity;

- substantial adverse effects on rare or endangered species, candidate species, other special-status species, or habitat of the species; or
- substantial adverse effects on fish communities or species protected by applicable environmental plans and goals.

5.11.2.2.1 Effect Assumptions

The determination of significance requires that:

- environmental conditions are measurably changed by the project,
- the change in environmental conditions significantly affects a species or its habitat,
- the change in environmental conditions is permanent or ongoing or affects a substantial proportion of the species population, or
- species population abundance is likely reduced, including a short-term reduction.

5.11.2.2.2 Effect Mechanisms

The assessment of effects considers the occurrence and potential occurrence of species and life stages relative to the magnitude, timing, frequency, and duration of program activities. Species habitat attributes potentially affected by construction activities include rearing habitat area and migration habitat conditions. Short-term effects on fish species attributable to bank protection activities include water quality effects and noise and disturbance. Long-term effects on fish habitat include loss of aquatic vegetation and SRA cover. This evaluation of effects on special-status fish species was based on the analysis of the proposed levee treatments.

Short-term construction effects are evaluated qualitatively based on general knowledge of the physiological tolerances and behavioral responses of listed fish species to potential increases in turbidity and suspended sediment, noise, and contaminants.

5.11.3 Effects and Mitigation Measures

5.11.3.1 No Action Alternative

The No Action Alternative would consist of the continuation of the existing deficiencies along the portion of the Sacramento River North Levee reach encompassed by The Rivers EIP project area (i.e., no levee improvements would be implemented to meet the minimum level of acceptable flood protection). Current levee operations and maintenance activities would continue. No construction-related release of contaminants would occur, and no noise and disturbance to special-status fish species or construction-related loss of habitat for special-status fish species would occur. The current levee maintenance activities, including mowing and application of herbicides, would continue.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to under-seepage, slope stability, or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the magnitude described in the Fisheries and Aquatics program analysis (Section 3.9.3.3.1). In summary, those effects could result in the displacement of

fish into flooded areas and the potential for stranding and mortality. In addition, significant water quality effects could result from the release of hazardous materials during a flooding event, which could lead to stress and direct mortality or significantly affect migration, spawning and rearing habitat of fish species. Emergency clean-up and earth-moving activities could also result in an increase in sediment and turbidity and the release of hazardous materials into the Sacramento Rivers and the Delta, and adjacent waterways that significantly affect migration, spawning or rearing habitat, or result in direct mortality of special status fish species. Given the unpredictable nature of emergency clean-up activities, is it likely that implementation of BMPs and measures to reduce effects on fish would not be possible. All of these effects would be considered significant.

5.11.3.2 The Rivers Applicant Preferred Alternative

Under The Rivers APA, construction activities would occur approximately 150 feet or more from the Sacramento River channel. Riparian trees would be removed and some nonnative understory vegetation would be trimmed and removed to construct flood and recreation program elements. This vegetation is approximately 100 to 150 feet from the Sacramento River and does not support SRA habitat.

Implementation of The Rivers APA would result in the following effects on fisheries and aquatic resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect FISH-3: Increase in Sedimentation and Turbidity in Adjacent Water Bodies as a Result of Construction	Less than significant	N/A	
Effect FISH-4: Release of Contaminants into Adjacent Water Bodies as a Result of Construction	Less than significant	N/A	
Effect FISH-5: Noise and Disturbance of Special-Status Fish Species as a Result of Construction	Less than significant	N/A	

Effect FISH-3: Increase in Sedimentation and Turbidity in Adjacent Water Bodies as a Result of Construction

The proposed project involves earth moving activities that could cause erosion and soil disturbance, subsequently resulting in sediment transport and delivery to aquatic habitats. Increases in sedimentation and turbidity have been shown to affect fish physiology, behavior, and habitat. However, the potential for adverse effects on fish from an increase in turbidity and sedimentation is low because the construction activities would be conducted during the typical construction season, which is outside the principal spawning and migration season, and fish abundance is typically low. Should migratory adult or juvenile salmonids be present, such species would be expected to bypass channel reaches with elevated turbidity and sediment levels because a sufficient portion of the channel's width (i.e., zone of passage) would remain unaffected. In addition, the implementation of the environmental commitment of an erosion and sediment control plan would minimize any increase in sedimentation. Therefore, this effect would be considered less than significant.

Effect FISH-4: Release of Contaminants into Adjacent Water Bodies as a Result of Construction

Construction activities for the proposed project may involve storage, use, or discharge of toxic and other harmful substances near the Sacramento River. Construction activities will involve the use of heavy equipment, cranes, compactors, and other construction equipment that uses petroleum products (e.g., fuels, lubricants, hydraulic fluids, coolants). All of these materials may be toxic to fish and other aquatic organisms. Construction activities will occur during the typical construction season, which is outside the principal spawning and migration season, and fish abundance is typically low. However, accidental spills of construction materials such as concrete, fuels, oils, and coolants could occur in adjacent wetlands or small drainage ditches that may drain to adjacent water bodies or the river. WSAFCA and its contractor will adhere to environmental commitments to implement an SWPPP and an SPCCP, and a BSSCP, as described in Section 2.9 of Chapter 2, Alternatives, which would make any construction-related effects on water quality (and fish or fish habitat) less than significant. If a spill were to occur, the SPCCP and BSSCP would be followed and Mitigation Measure WQ-MM-1, Implement Measures to Maintain Surface Water Quality and Groundwater Quality (as described in Section 5.5, Water Quality and Groundwater Resources), would be implemented to ensure water quality is returned to baseline conditions.

Effect FISH-5: Noise and Disturbance of Special-Status Fish Species as a Result of Construction

Construction-related short-term effects on fish would include effects related to noise, vibrations, artificial light, and other physical disturbances caused by heavy equipment operation. These types of physical disturbances can disrupt or delay normal activities, or cause injury or mortality. The potential magnitude of effects depends on a number of factors, including the type and intensity of the disturbance, proximity of the action to the water body, timing of actions relative to the occurrence of sensitive life stages, and frequency and duration of activities.

Construction activities for the proposed project are at a distance from the Sacramento River that these types of effects would be unlikely. In addition, construction-related noise levels are not expected to cause delay or adversely affect upstream or downstream migration of salmon, steelhead, and other migratory species for the reasons listed below.

- Construction would be limited to the typical construction season and during periods of low abundance, and outside the principal spawning and migration season. Typical construction season generally corresponds to the dry season, but WSLIP construction may occur outside the limits of the dry season, only as allowed by applicable permit conditions.
- Migratory and resident fish would likely move upstream, downstream, or laterally to an unaffected portion of the river in response noise or disturbance and would therefore be unaffected.
- If present, migratory species, such as adult and juvenile salmonids, would be expected to bypass channel reaches with noises or disturbances because a sufficient portion of the channel's width (i.e., zone of passage) would remain unaffected.

5.11.3.3 The Rivers Alternative B

Under The Rivers Alternative B, riparian trees would be removed and some nonnative understory vegetation would be trimmed and removed to construct flood and recreation program elements and to comply with USACE vegetation policy. This vegetation is approximately 100 to 150 feet from the Sacramento River and does not support SRA habitat.

Implementation of The Rivers Alternative B would result in the following effect on fisheries and aquatic resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect FISH-3: Increase in Sedimentation and Turbidity in Adjacent Water Bodies as a Result of Construction	Less than significant	N/A	
Effect FISH-4: Release of Contaminants into Adjacent Water Bodies as a Result of Construction	Less than significant	N/A	
Effect FISH-5: Noise and Disturbance of Special-Status Fish Species as a Result of Construction	Less than significant	N/A	

Effect FISH-3: Increase in Sedimentation and Turbidity in Adjacent Water Bodies as a Result of Construction

This effect would be the same as described above under The Rivers APA. The potential for adverse effects on fish from an increase in turbidity and sedimentation is low because the construction activities will be conducted during the typical construction season when fish abundance is low and outside the principal spawning and migration season. In addition, the implementation of the environmental commitment of an erosion and sediment control plan would minimize any increase in sedimentation. Therefore, this effect would be considered less than significant.

Effect FISH-4: Release of Contaminants into Adjacent Water Bodies as a Result of Construction

This effect would be the same as described above under The Rivers APA. WSAFCA and its contractor will adhere to environmental commitments to implement an SWPPP and an SPCCP, and a BSSCP, as described in Section 2.9 of Chapter 2, Alternatives, which would make any construction-related effects on water quality (and fish or fish habitat) less than significant.

Effect FISH-5: Noise and Disturbance of Special-Status Fish Species as a Result of Construction

This effect would be the same as described above under The Rivers APA. It is unlikely that construction activities for the proposed project would cause short-term effects on fish because of the project location's distance from the Sacramento River and the typical low abundance of fish in the river during the construction season. This effect is considered less than significant.

Section 5.12
Wildlife—
The Rivers Early Implementation Project

5.12.1 Affected Environment

This section describes the affected environment for wildlife resources in The Rivers EIP project area, including regulatory and environmental setting.

5.12.1.1 Regulatory Setting

5.12.1.1.1 Federal

The following Federal policies related to wildlife resources may apply to The Rivers EIP. Please see Section 3.10.2.1, Regulatory Setting, for a more complete description of each policy

- Federal Endangered Species Act
- Section 7: ESA Authorization Process for Federal Actions
- Section 9: ESA Prohibitions
- Migratory Bird Treaty Act
- Fish and Wildlife Coordination Act
- Federal Endangered Species Act

5.12.1.1.2 State

- California Endangered Species Act
- California Fish and Game Code

5.12.1.1.3 Local

- City of West Sacramento General Plan
- Yolo County General Plan

5.12.1.2 Environmental Setting

This section discusses the environmental setting related to wildlife in the study area for The Rivers EIP (defined below), including the methods used to evaluate wildlife habitat including vegetation and wetland conditions, a description of existing land cover types in the project study area, identification of waters of the United States (including wetlands), and discussions of the special-status wildlife species that are known to occur in the project region.

5.12.1.2.1 Study Area

The Rivers EIP study area is approximately 4,400 feet in length and is located on the Sacramento River North Levee, just north of the confluence of the Sacramento and American Rivers, including part of The Rivers residential development. For the purposes of the wildlife analysis, the study area consists of the project area plus an approximate 100-foot-wide buffer zone that accounts for potential indirect effects on VELB. The study area encompasses portions of the Sacramento River North Levee with a majority of the study area consisting of the levee itself. The topography of the portion of the study area adjacent to the levee is relatively level. Elevations in the study area range from approximately 20 to 26 feet above mean sea level. The majority of the study area on the landside of the levee consists of residential development and a school. A single row of houses is located on top of the levee in the southern portion of the study area. The waterside of the levee is undeveloped and supports a well-developed riparian corridor.

5.12.1.2.2 Field Surveys

Pre-Field Investigation

An ICF Jones & Stokes biologist reviewed CNDDB (2009b) and USFWS (2009) species lists and aerial photographs for the study area prior to field surveys.

Reconnaissance-Level Site Visits

An initial general survey of the project area was conducted by ICF Jones & Stokes wildlife biologists on November 29, 2007. The survey was conducted by walking around the study area to visually assess potential wildlife resources. Focused surveys of the project area, including an elderberry shrub (the host plant for VELB) survey, were conducted by ICF Jones & Stokes biologists on January 9, 2009. During all surveys wildlife habitat uses associated with land cover types were identified, habitats were evaluated for their ability to support special-status wildlife species, and all wildlife species observed were recorded (Table 5.12-1).

Table 5.12-1. Wildlife Species Observed in The Rivers EIP Study Area

Common Name	Scientific Name
Birds	
Acorn woodpecker	*Melanerpes formicivorus*
American crow	*Corvus brachyrhynchos*
American Goldfinch	*Carduelis tristis*
American kestrel	*Falco sparverius*
Black phoebe	*Sayornis nigricans*
Brewer's blackbird	*Euphagus cyanocephalus*
Bushtit	*Psaltriparus minimus*
California towhee	*Pipilo crissalis*
Canada goose	*Branta canadensis*
Dark-eyed junco	*Junco hyemalis*
European starling	*Sturnus vulgaris*
Golden-crowned sparrow	*Zonotrichia atricapilla*
Gull sp.	*Larus* sp.

Common Name	Scientific Name
House wren	*Troglodytes aedon*
Killdeer	*Charadrius vociferus*
Mallard	*Anas platyrhynchos*
Mourning dove	*Zenaida macroura*
Northern flicker	*Colaptes auratus*
Red-tailed hawk	*Buteo jamaicensis*
Rock dove	*Columba livia*
Snowy egret	*Egretta thula*
Spotted towhee	*Pipilo erythrophthalmus*
Turkey vulture	*Cathartes aura*
Western meadow lark	*Sturnella neglecta*
Western scrub jay	*Aphelocoma californica*
White-crowned sparrow	*Zonotrichia leucophrys*
Yellow-rumped warbler	*Dendroica coronata*
Mammals	
Black-tailed jack rabbit	*Lepus californicus*

Elderberry Surveys

Elderberry shrub surveys were conducted for the majority of the study area where flood improvements and the recreation trail on the crown of the levee occur. A protocol level survey of the construction areas for pedestrian trail foot paths and landings leading to the Sacramento River has not yet been conducted. However, the presence of elderberry shrubs in these areas was noted during reconnaissance level site visits. Surveys of these areas will be completed prior to project implementation.

Elderberry shrub surveys consisted of walking through the project area and mapping, with a GPS, all elderberry shrubs (and shrub clusters) within 100 feet of portions of the proposed construction area (as noted above) in accordance with the USFWS Conservation Guidelines for the VELB (U.S. Fish and Wildlife Service 1999a). Other information recorded for each shrub included number of stems between 1 and 3 inches, 3 and 5 inches, and greater than 5 inches in diameter; whether each stem 1 inch or more in diameter is located in a riparian or non-riparian area; approximate height and width of the elderberry shrub; presence of VELB exit holes; and dominant vegetation that is associated with the elderberry shrub.

5.12.1.2.3 Wildlife Habitat—Land Cover Type Associations

The study area contains the following land cover types: Great Valley valley oak riparian forest, non-native annual grassland, and unvegetated/vacant/developed areas. Additionally, the Sacramento River (open water) occurs within 50 feet of portions of the study area; therefore, a discussion of this habitat is also included. These land cover types are discussed below with respect to the habitat they provide for wildlife. A detailed description of each of these types, including the dominant plants contained within each type, is in Section 3.8, Vegetation and Wetlands. These land cover types are shown in Figure 5.10-1 along with acreages of these types occurring within the construction limit, staging area, and larger study area.

Great Valley Valley Oak Riparian Forest

In the study area, riparian forest occurs along the Sacramento River North Levee adjacent to the Sacramento River. The overstory of the riparian habitat consists of mature, well-established trees: Fremont cottonwood (*Populus fremontii* ssp*. fremontii*), valley oak (*Quercus lobata*), black willow (*Salix gooddingii*), and box elder (*Acer negundo* var. *californicum*) with a shrub layer of smaller trees and shrubs. Elderberry shrubs (*Sambucus mexicana*), which are the host plant of VELB, were observed within this community.

Overstory trees may be used for nesting and roosting by numerous raptors, including Swainson's hawk (*Buteo swainsoni*), white-tailed kite (*Elanus leucurus*), red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), great horned owl (*Bubo virginianus*), Cooper's hawk (*Accipiter cooperii*), and American kestrel (*Falco sparverius*) as well as the herons and egrets mentioned below as foraging in open water areas. Overstory trees also provide suitable habitat for song birds such as Bullock's oriole (*Icterus bullockii*), yellow-rumped warbler (*Dendroica coronata*), tree swallow (*Tachycineta bicolor*), and western scrub jay (*Aphelocoma californica*). Riparian forest also provides important foraging habitat for resident, migratory, and wintering songbirds. The understory of riparian woodlands provide habitat for mammals, including various species of rodents, raccoon (*Procyon lotor*), Virginia opossum (*Didelphis virginiana*), and striped skunk (*Mephitis mephitis*). Areas containing large, dense shrubby vegetation dominated by willow or blackberry may support tricolored blackbird (*Agelaius tricolor*). Riparian forests also provide cover and foraging habitat for reptiles and amphibians, such as terrestrial garter snake (*Thamnophis elegans*), gopher snake (*Pituophis catenifer*), Pacific tree frog (*Hyla regilla*), and western toad (*Bufo boreas*). Suitable areas in the understory may also be used as nesting habitat for western pond turtles (*Actinemys marmorata*).

Non-Native Annual Grassland

Non-native annual grassland in the study area occurs on and adjacent to the Sacramento River North Levee, and consists of non-native annual grasses and forbs.

Annual grasslands provide nesting and foraging habitat for several species of songbirds, including savanna sparrow (*Passerculus sandwichensis*), white-crowned sparrow (*Zonotrichia leucophrys*), and western meadowlark (*Sturnella neglecta*); and foraging habitat for several species of raptors, including red-tailed hawk, white-tailed kite, northern harrier, great-horned owl, and Swainson's hawk. California ground squirrels commonly occur in annual grassland habitat. Their burrows provide important nesting habitat for western burrowing owls (*Athene cunicularia hypugea*). Reptiles found in these habitats include California kingsnake, gopher snake, and western rattle snake (*Crotalus viridis*).

Unvegetated/Vacant/Developed

The unvegetated/vacant/developed portions of the study area consist of unvegetated portions of the Sacramento River North Levee, paved and unpaved roads and trails, and residential housing. These areas likely support common wildlife species including house sparrow (*Passer domesticus*), house finch (*Carpodacus mexicanus*), European starling (*Sturnus vulgaris*), Brewer's blackbird (*Euphagus cyanocephalus*), American crow (*Corvus brachyrhynchos*), mourning dove, rock dove (*Columba livia*), Virginia opossum (*Didelphis virginiana*), California ground squirrel, and California meadow vole, to name a few. Scattered landscape trees and shrubs associated with this area may provide nesting habitat for the above-listed common birds.

Open Water

Open water habitat adjacent to the study area consists of the Sacramento River. Open water provides breeding, foraging, and migration habitat for numerous wildlife species. Mammal species commonly known to use perennial aquatic open water habitats include river otter, which uses these areas for foraging and escape cover, and muskrat, which may use deepwater areas as migration corridors between suitable foraging areas. Open water areas also provide essential foraging habitat for wading birds including great blue heron (*Ardea herodias*), great egret (*Ardea alba*), and snowy egret (*Egretta thula*), numerous waterfowl species including mallard (*Anas platyrhynchos*), ruddy duck (*Oxyura jamaicensis*), bufflehead (*Bucephala albeola*), other water birds including eared grebe (*Podiceps nigricollis*), double-crested cormorants (*Phalacrocorax auritus*), American white pelicans (*Pelecanus erythrorhynchos*), and land birds including black phoebe (*Sayornis nigricans*) and belted kingfisher (*Megaceryle alcyon*). These areas also provide rearing habitat, escape cover, and foraging habitat for reptiles and amphibians including western pond turtle (*Actinemys marmorata*), common garter snake (*Thamnophis sirtalis*), bullfrog (*Rana catesbeiana*), Pacific tree frog (*Hyla regilla*), and western toad (*Bufo boreas*). The vegetated areas below the OHWM provide nesting habitat for numerous songbirds, including red-winged blackbird (*Agelaius phoeniceus*), marsh wren (*Cistothorus palustris*), and wading birds such as Virginia rail (*Rallus limicola*).

5.12.1.2.4 Special-Status Wildlife

Special-status wildlife species are animals that are legally protected under the ESA, CESA, or other regulations and species that are considered sufficiently rare by the scientific community to qualify for such listing. Special-status species definitions are included in the Program Environmental Setting section.

Based on the USFWS (2009) list for the quadrangle in the study area and Yolo County, a review of CNDDB (2009b) occurrences within a 10-mile radius of the study area, and information collected during field surveys, 35 special-status wildlife species were identified as having potential to occur in the project area (Table 5.12-2). Of these, 21 have low to no potential to occur in the study area because the study area is outside the species' known range or suitable habitat is absent from the study area. The remaining 14 wildlife species identified as having potential to occur in the study area include the VELB, giant garter snake, Western pond turtle, Swainson's hawk, white-tailed kite, loggerhead shrike, tricolored blackbird, purple martin, bank swallow, northern harrier, western burrowing owl, hoary bat, western red bat, and pallid bat.

The protection status, distributional range, and habitat requirements for these species are described in the Program Environmental Setting section. Information regarding species occurrence within a 10-mile radius of the study area and the suitability of the study area for a particular species is presented below.

Table 5.12-2. Special-Status Wildlife Species with Potential to Occur in The Rivers EIP Study Area

Common and Scientific Names	Status Federal/ State/Other	Geographic Distribution	Habitat Requirements	Potential Occurrence in Study Area
Invertebrates				
Delta green ground beetle *Elaphrus viridus*	T/–	Restricted to Olcott Lake and other vernal pools at Jepson Prairie Preserve, Solano County	Sparsely vegetated edges of vernal lakes and pools; occur up to 250 feet from pools	None. Study area is outside of the species' range.
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	T/–/–	Stream side habitats below 3,000 feet throughout the Central Valley	Riparian and oak savanna habitats with elderberry shrubs; elderberries are the host plant	High. Known occurrences within a mile of the study area.
Conservancy fairy shrimp *Branchinecta conservatio*	E/–/–	Disjunct occurrences in Solano, Merced, Tehama, Ventura, Butte, and Glenn Counties	Large, deep vernal pools in annual grasslands	None. Study area is outside of the species' range.
Vernal pool fairy shrimp *Branchinecta lynchi*	T/–/–	Central Valley, central and south Coast Ranges from Tehama County to Santa Barbara County. Isolated populations also in Riverside County.	Common in vernal pools; also found in sandstone rock outcrop pools.	None. No suitable habitat in the study area.
Vernal pool tadpole shrimp *Lepidurus packardi*	E/–/–	Shasta County south to Merced County	Vernal pools and ephemeral stock ponds	None. No suitable habitat in the study area.
Lange's metalmark butterfly *Apodemia mormo langei*	E/–/–	Once found throughout the Antioch Dunes; range now reduced to less than 10 acres of Antioch Dunes in Contra Costa County	Limited to dense to moderately dense patches of food plant, wild buckwheat, in stabilized sand dunes	None. Study area is outside of the species' range.
Amphibians				
California tiger salamander *Ambystoma californiense*	T/C/–	Central Valley, including Sierra Nevada foothills, up to approximately 1,000 feet, and coastal region from Butte County south to northeastern San Luis Obispo County.	Small ponds, lakes, or vernal pools in grass-lands and oak woodlands for larvae; rodent burrows, rock crevices, or fallen logs for cover for adults and for summer dormancy	None. No suitable habitat in the study area.
California red-legged frog *Rana aurora draytonii*	T/SSC/–	Found along the coast and coastal mountain ranges of California from Marin County to San Diego County and in the Sierra Nevada from Tehama County to Fresno County	Permanent and semi-permanent aquatic habitats, such as creeks and cold-water ponds, with emergent and submergent vegetation. May estivate in rodent burrows or cracks during dry periods.	None. The study area is outside of this species current known range. This species is believed to be extirpated from the valley floor.

Common and Scientific Names	Status Federal/ State/Other	Geographic Distribution	Habitat Requirements	Potential Occurrence in Study Area
Reptiles				
Silvery legless lizard *Anniella pulchra pulchra*	–/SSC/–	Along the Coast, Transverse, and Peninsular Ranges from Contra Costa County to San Diego County with spotty occurrences in the San Joaquin Valley	Habitats with loose soil for burrowing or thick duff or leaf litter; often forages in leaf litter at plant bases; may be found on beaches, sandy washes, and in woodland, chaparral, and riparian areas	Low. No CNDDB occurrences within 10 miles of the study area. Potential habitat in the study area.
Giant garter snake *Thamnophis couchi gigas*	T/T/–	Central Valley from the vicinity of Burrel in Fresno County north to near Chico in Butte County; has been extirpated from areas south of Fresno	Sloughs, canals, low gradient streams and freshwater marsh habitats where there is a prey base of small fish and amphibians; also found in irrigation ditches and rice fields; requires grassy banks and emergent vegetation for basking and areas of high ground protected from flooding during winter	Low to None. CNDDB occurrences within three miles of study area. No suitable habitat within study area.
Western pond turtle *Actinemys marmorata*	–/SSC/–	Occurs from the Oregon border of Del Norte and Siskiyou Counties south along the coast to San Francisco Bay, inland through the Sacramento Valley, and on the western slope of Sierra Nevada	Occupies ponds, marshes, rivers, streams, and irrigation canals with muddy or rocky bottoms and with watercress, cattails, water lilies, or other aquatic vegetation in woodlands, grasslands, and open forests	Moderate. Species observed within ponds 3 miles south of study area along South River Road. Suitable habitat within study area.
Birds				
Double-crested cormorant *Phalacrocorax auritus* (rookery site)	–/SSC/–	Winters along the entire California coast and inland over the Coast Ranges into the Central Valley from Tehama County to Fresno County; a permanent resident along the coast from Monterey County to San Diego County, along the Colorado River, Imperial, Riverside, Kern and King Co.s, and the islands off San Francisco; breeds in Siskiyou, Modoc, Lassen, Shasta, Plumas, and Mon Co.s; also breeds in the San Francisco Bay Area and in Yolo and Sacramento Counties	Rocky coastlines, beaches, inland ponds, and lakes; needs open water for foraging, and nests in riparian forests or on protected islands, usually in snags	Low. No CNDDB nesting records within 10 miles of the study area. No nesting or foraging habitat within study area.

Common and Scientific Names	Status Federal/ State/Other	Geographic Distribution	Habitat Requirements	Potential Occurrence in Study Area
White-faced ibis *Plegadis chihi* (rookery site)	–/SSC	Both resident and winter populations on the Salton Sea and in isolated areas in Imperial, San Diego, Ventura, and Fresno Counties; breeds at Honey Lake, Lassen County, at Mendota Wildlife Management Area, Fresno County, and near Woodland, Yolo County.	Prefers freshwater marshes with tules, cattails, and rushes, but may nest in trees and forage in flooded agricultural fields, especially flooded rice fields	Low. No CNDDB nesting records within 10 miles of the study area. No suitable nesting or foraging habitat within study area.
California black rail *Laterallus jamaicensis coturniculus*	–/T/–	Permanent resident in the San Francisco Bay and eastward through the Delta into Sacramento and San Joaquin Counties; small populations in Marin, Santa Cruz, San Luis Obispo, Orange, Riverside, and Imperial Counties.	Tidal salt marshes associated with heavy growth of pickleweed; also occurs in brackish marshes or freshwater marshes at low elevations.	None. No CNDDB nesting records within 10 miles of the study area. No suitable habitat within study area.
California clapper rail *Rallus longirostris obsoletus*	E/E/–	Marshes around the San Francisco Bay and east through the Delta to Suisun Marsh	Restricted to salt marshes and tidal sloughs; usually associated with heavy growth of pickle-weed; feeds on mollusks removed from the mud in sloughs	None. Study area is outside of the species' range.
Mountain plover *Charadrius montanus*	PT/SSC	Does not breed in California; in winter, found in the Central Valley south of Yuba County, along the coast in parts of San Luis Obispo, Santa Barbara, Ventura, and San Diego Counties; parts of Imperial, Riverside, Kern, and Los Angeles Counties	Occupies open plains or rolling hills with short grasses or very sparse vegetation; nearby bodies of water are not needed; may use newly plowed or sprouting grain fields	None. Study area is outside of the species' breeding range, unlikely to forage in study area.
Western snowy plover (inland population) *Charadrius alexandrinus nivosus*	–/SSC	Nests at inland lakes throughout northeastern, central, and southern California, including Mono Lake and Salton Sea	Barren to sparsely vegetated ground at alkaline or saline lakes, reservoirs, ponds and riverine sand bars; also along sewage, salt-evaporation, and agricultural waste-water ponds	None. No suitable nesting or foraging habitat in the study area.

Common and Scientific Names	Status Federal/ State/Other	Geographic Distribution	Habitat Requirements	Potential Occurrence in Study Area
Northern harrier *Circus cyaneus*	–/SSC	Occurs throughout lowland California. Has been recorded in fall at high elevations	Grasslands, meadows, marshes, and seasonal and agricultural wetlands	Moderate. No CNDDB nesting records within 10 miles of the study area. Marginally suitable nesting habitat in study area. Suitable foraging habitat in grasslands adjacent to levee.
White-tailed kite *Elanus leucurus*	–/ FP/–	Lowland areas west of Sierra Nevada from the head of the Sacramento Valley south, including coastal valleys and foothills to western San Diego County at the Mexico border	Low foothills or valley areas with valley or live oaks, riparian areas, and marshes near open grasslands for foraging	High. CNDDB nesting records within 3 miles of study area. Suitable nesting and foraging habitat in study area.
Swainson's hawk *Buteo swainsoni*	–/T/–/–	Lower Sacramento and San Joaquin Valleys, the Klamath Basin, and Butte Valley. Highest nesting densities occur near Davis and Woodland, Yolo County.	Nests in oaks or cottonwoods in or near riparian habitats. Forages in grasslands, irrigated pastures, and grain fields.	High. CNDDB nesting records within study area.
Western burrowing owl *Athene cunicularia hypugea*	–/SSC/–	Lowlands throughout California, including the Central Valley, northeastern plateau, southeastern deserts, and coastal areas. Rare along south coast	Level, open, dry, heavily grazed or low stature grassland or desert vegetation with available burrows	High. CNDDB nesting records within a mile of the study area. Suitable nesting and foraging habitat in study area.
Western yellow-billed cuckoo *Coccyzus americanus occidentalis*	–/E	Nests along the upper Sacramento, lower Feather, south fork of the Kern, Amargosa, Santa Ana, and Colorado Rivers	Wide, dense riparian forests with a thick understory of willows for nesting; sites with a dominant cottonwood overstory are preferred for foraging; may avoid valley-oak riparian habitats where scrub jays are abundant	None. No suitable nesting habitat in the study area; forests in study area are dominated by valley oak and contain abundant scrub jays.
Loggerhead shrike *Lanius ludovicianus*	–/SSC/–	Resident and winter visitor in lowlands and foothills throughout California; rare on coastal slope north of Mendocino County, occurring only in winter	Prefers open habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches	Moderate. No CNDDB nesting records within 10 miles of the study area. Suitable nesting and foraging habitat in study area.

Common and Scientific Names	Status Federal/ State/Other	Geographic Distribution	Habitat Requirements	Potential Occurrence in Study Area
Tricolored blackbird *Agelaius tricolor*	–/SSC/–	Permanent resident in the Central Valley from Butte County to Kern County; breeds at scattered coastal locations from Marin County south to San Diego County and at scattered locations in Lake, Sonoma, and Solano Counties; rare nester in Siskiyou, Modoc, and Lassen Counties	Nests in dense colonies in emergent marsh vegetation, such as tules and cattails, or upland sites with blackberries, nettles, thistles, and grain fields; habitat must be large enough to support 50 pairs; probably requires water at or near the nesting colony	Low. CNDDB nesting records 2 miles south of the study area. No suitable nesting habitat in study area; marginally suitable foraging habitat in grasslands adjacent to levee.
Yellow-headed blackbird *Xanthocephalus xanthocephalus*	–/SSC/–	Locally numerous in the Klamath Basin, Modoc Plateau, Great Basin desert, and large mountain valleys in northeastern California; and in the San Joaquin Valley. Common breeders in the Colorado River valley, the Salton Sink, and the western Mojave desert; scarce in the Sacramento Valley and along the southern coast in Los Angeles, Riverside, and San Bernardino counties.	Nest in marshes with tall emergent vegetation, such as tules or cattails, generally in open areas and edges over relatively deep water. Breeding marshes often on edges of deep water bodies such as lakes, reservoirs, and or larger ponds.	None. CNDDB nesting records approximately 10 miles south of the study area. No suitable nesting or foraging habitat in the study area.
Purple martin *Progne subis*	–/SSC/–	Coastal mountains south to San Luis Obispo County, west slope of the Sierra Nevada, and northern Sierra and Cascade ranges. Absent from the Central Valley except in Sacramento. Isolated, local populations in southern California	Nests in abandoned woodpecker holes in oaks, cottonwoods, and other deciduous trees in a variety of wooded and riparian habitats. Also nests in vertical drainage holes under elevated freeways and highway bridges	Moderate. CNDDB nesting records under nearby freeway approximately 2 miles southeast of the study area. Suitable nesting habitat in study area.
Bank swallow *Riparia riparia*	–/T/–	Occurs along the Sacramento River from Shasta County to Sacramento County, along the Feather and lower American Rivers, in the Owens Valley; and in the plains east of the Cascade Range in Modoc, Lassen, and northern Siskiyou Counties. Small populations near the coast from San Francisco County to Monterey County	Nests in bluffs or banks, usually adjacent to water, where the soil consists of sand or sandy loam	Low. CNDDB nesting records approximately 5 miles southeast of the study area. No suitable nesting habitat in the study area.

Common and Scientific Names	Status Federal/ State/Other	Geographic Distribution	Habitat Requirements	Potential Occurrence in Study Area
Saltmarsh common yellowthroat *Geothlypis trichas sinuosa*	–/SSC/–	Found only in the San Francisco Bay Area in Marin, Napa, Sonoma, Solano, San Francisco, San Mateo, Santa Clara, and Alameda Counties	Freshwater marshes in summer and salt or brackish marshes in fall and winter; requires tall grasses, tules, and willow thickets for nesting and cover	None. Study area is outside of the species' range.
Grasshopper sparrow *Ammodramus savannarum*	–/SSC/–	Summer resident in the foothills of the Sierra Nevada and Coast Range from Mendocino and Trinity counties south to San Diego County.	Dry, dense grasslands with a variety of grasses and tall forbs and scattered shrubs.	Low. No CNDDB nesting records within study area. Potential nesting habitat within study area.
Suisun song sparrow *Melospiza melodia maxillaris*	–/SSC/–	Restricted to the extreme western edge of the Delta, between the cities of Vallejo and Pittsburg near Suisun Bay	Brackish and tidal marshes supporting cattails, tules, various sedges, and pickleweed	None. Study area is outside of the species' range.
Mammals				
Hoary bat *Lasurius cinerius*	–/SSC/–	Occurs throughout California from sea level to 13,200 feet.	Primarily found in forested habitats. Also found in riparian areas and in park and garden settings in urban areas. Day roosts within foliage of trees.	Moderate. Not reported to occur within study area; reported in CNDDB to occur approximately 2 miles of the study area. Suitable roosting habitat in study area.
Pallid bat *Antrozous pallidus*	–/SSC/FSS, WBWG: High priority	Occurs throughout California except the high Sierra from Shasta to Kern County and the northwest coast, primarily at lower and mid elevations	Occurs in a variety of habitats from desert to coniferous forest. Most closely associated with oak, yellow pine, redwood, and giant sequoia habitats in northern California and oak woodland, grassland, and desert scrub in southern California. Relies heavily on trees for roosts	Moderate. Not reported to occur within study area; no CNDDB record reported to occur within 10 of the study area. Suitable roosting habitat in study area.
Western red bat *Lasiurus blossevillii*	–/–/FSS, WBWG: High priority	Scattered throughout much of California at lower elevations	Found primarily in riparian and wooded habitats. Occurs at least seasonally in urban areas. Day roosts in trees within the foliage. Found in fruit orchards and sycamore riparian habitats in the central valley	Moderate. Not reported to occur within study area; no CNDDB record reported to occur within 10 of the study area. Suitable roosting habitat in study area.

Common and Scientific Names	Status Federal/ State/Other	Geographic Distribution	Habitat Requirements	Potential Occurrence in Study Area
Salt marsh harvest mouse *Reithrodontomys raviventris*	E/E, FP	San Francisco, San Pablo, and Suisun Bays; the Delta	Salt marshes with a dense plant cover of pickle-weed and fat hen; adjacent to an upland site	None. Study area is outside of the species' range.
American badger *Taxidea taxus*	–/SSC/–	In California, badgers occur throughout the state except in humid coastal forests of northwestern California in Del Norte and Humboldt Counties	Badgers occur in a wide variety of open, arid habitats but are most commonly associated with grasslands, savannas, mountain meadows, and open areas of desert scrub; the principal habitat requirements for the species appear to be sufficient food (burrowing rodents), friable soils, and relatively open, uncultivated ground	Low. One historic record (1938) reported approximately 8 miles from the study area. Study area contains limited suitable habitat for this species.

Status explanations:

Federal

E = listed as endangered under the Federal Endangered Species Act.

T = listed as threatened under the Federal Endangered Species Act.

P = species for which USFWS has on file sufficient information on biological vulnerability and threat(s) to support issuance of a proposed rule to list, but issuance of the proposed rule is precluded.

– = no listing.

State

E = listed as endangered under the California Endangered Species Act.

T = listed as threatened under the California Endangered Species Act.

FP = fully protected under the California Fish and Game Code.

SSC = species of special concern in California.

C = candidate for listing

– = no listing.

Western Bat Working Group (WBWG) Available: http://www.wbwg.org/spp_matrix.html)

High priority = species are imperiled or at high risk of imperilment

Moderate priority= this designation indicates a level of concern that should warrant closer evaluation, more research, and conservation actions of both the species and possible threats. A lack of meaningful information is a major obstacle in adequately assessing these species' status and should be considered a threat

Low priority = While there may be localized concerns, the overall status of the species is believed to be secure.

1

Valley Elderberry Longhorn Beetle

Although no occurrences of VELB in the study area have been reported, there are numerous within 10 miles of the study area (California Natural Diversity Database 2009b). Three occurrences are located within 1 mile of the study area. Although not reported to occur in the study area, elderberry shrubs sized 1 inch or more at ground level are present in the study area and therefore VELB has potential to occur. See elderberry shrub survey map Figure 5.12-1 for locations of these shrubs.

Giant Garter Snake

There are no CNDDB (2009b) records for giant garter snakes in the study area, although there are numerous occurrences within 10 miles. The closest occurrence is located approximately 3miles from the study area in an agricultural drainage. This occurrence is labeled as sensitive and therefore provides minimal information about the occurrence location. There are approximately 25 other recorded occurrences within 10 miles of the study area, most of which are also labeled as sensitive and therefore no specific location information is available (California Natural Diversity Database 2009b).

The Sacramento River is the only aquatic habitat in close proximity to the study area. Giant garter snakes are known to utilize low gradient streams but the Sacramento River contains high flows that would not support giant garter snakes.

Western Pond Turtle

CNDDB (2009b) records do not indicate any western pond turtle occurrences in the study area. Pond turtles have been incidentally observed approximately 3miles southeast of the study area in ponds west of South River Road, by ICF Jones & Stokes biologists. Additionally, western pond turtle is recorded to occur 7 miles east of the study area in a drainage at the McClellan Air Force Base (California Natural Diversity Database 2009b).

The Sacramento River is the only aquatic habitat in close proximity to the study area. If present in the Sacramento River, pond turtles could use riparian habitat in the study area for winter hibernacula and nesting.

Swainson's Hawk

Swainson's hawk is known to nest in trees in and adjacent to the study area. The closest reported nest site is located in a cottonwood tree within 30 feet of the Sacramento River at RM 61.5. The nest site was last observed to be active in 1993 (California Natural Diversity Database 2009b). Grasslands in the study area are likely used as foraging habitat by this species.

White-Tailed Kite

There are no CNDDB (2009b) occurrences for white-tailed kite in the study area. Several nest sites are reported to occur within a 10-mile radius, the closest being a nest site within 3 miles of the study area along the American River (California Natural Diversity Database 2009b). Large trees within and adjacent to the study area provide suitable nesting habitat, and grasslands provide suitable foraging habitat.

Loggerhead Shrike

CNDDB (2009b) records do not indicate any loggerhead shrike occurrences within 10 miles of the study area. However, the study area is within the expected range for this species. Scattered trees and shrubs in the study area have potential to support nesting of this species and grasslands provide suitable foraging habitat.

Tricolored Blackbird

There are no CNDDB (2009b) occurrences for tricolored blackbird in the study area. Within 10 miles of the study area, CNDDB (2009b) indicated one tricolored blackbird nesting site, located approximately 2 miles south of the study area near the Port of Sacramento, in the vicinity of the Port North Levee. The birds were reported to be nesting in an area containing thistle and mustard in 1969 and 1974. The size of this population was not reported. Himalayan blackberry brambles and grasslands containing dense forbs in the study area provide suitable nesting habitat. Grasslands in the study area also contain suitable foraging habitat for this species.

Purple Martin

There are no CNDDB (2009b) occurrences for purple martin in the study area. The nearest CNDDB (2009b) occurrence for this species is for a colony nesting in weep holes under the I-5 freeway overpass at I Street approximately 2 miles east of the study area. Numerous other occurrences are reported within a 10-mile radius for colonies nesting under freeway or street overpasses. Suitable nesting habitat for this species occurs in the riparian forest areas in the study area.

Bank Swallow

There are no CNDDB (2009b) occurrences for this species in the study area. Numerous CNDDB nesting records for this species occur approximately 5 miles southeast of the study area along the American River. Additionally this species is recorded in CNDDB to nest approximately 14 miles north of the study area along the Sacramento River. Banks along the Sacramento River, located within and adjacent to the study area, are heavily vegetated with Himalayan blackberry, aquatic and upland grasses, and willows and do not provide suitable nesting habitat for bank swallow. The study area does not contain any potential nesting habitat for this species.

Northern Harrier

CNDDB (2009b) records do not indicate any northern harrier occurrences in the study area or within 10 miles of the study area. Annual grasslands in the study area provide suitable foraging habitat but would be unlikely to support nesting because a majority of the grassland habitat is within the levee itself.

Western Burrowing Owl

There are no CNDDB (2009b) occurrences for this species in the study area though numerous burrowing owl occurrences are reported within 10 miles of the study area. The closest recorded nesting record is within 1 mile of the site located 0.2 mile southwest of the intersection of Highway 84 and Harbor Boulevard, within the Sacramento River North Levee reach. Grasslands within and alongside the Sacramento River North Levee reach provide suitable nesting habitat where ground

Q:\PROJECTS\HDR\00875_07\MAPDOC\ELDERBERRY\THE_RIVERS_ELDERBERRY_FIG5_12_1_V3.MXD SS (11-24-09)

Figure 5.12-1
The Rivers Site: Elderberry Shrub Survey Map

squirrel burrows are present and open grassland areas near suitable nesting habitat provide suitable foraging habitat.

Special-Status Bats

There are no CNDDB (2009b) occurrences for these species in the study area. Within 10 miles of the study area, CNDDB (2009b) records indicate a hoary bat observation approximately2 miles south of the study area within the Sacramento River North Levee reach. CNDDB (2009b) records do not indicate any western red bat or pallid bat observations within 10 miles of the study area. Riparian forest in the study area provides suitable roosting habitat for these species, while the adjacent Sacramento River provides suitable foraging habitat.

5.12.2 Environmental Consequences

This section describes the environmental consequences relating to wildlife for the proposed The Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.10.3.3, Effects and Mitigation Measures.

5.12.2.1 Assessment Methods

The effect analysis below is quantitative and is based on site-specific information. The mitigation measures described for potential effects on sensitive biological resources have not been developed through consultation with resource agencies (e.g., DFG, USFWS, and USACE) at this time but are based on standard agency guidance.

The key effects were identified and evaluated based on the environmental characteristics of The Rivers EIP project area and the magnitude, intensity, and duration of activities related to the construction and operation of this project.

5.12.2.1.1 Effects Mechanisms

The following project-related activities could affect wildlife resources in the study area. These types of direct and indirect effects were used to assess effects on wildlife resources.

Direct Effects

Direct effects on wildlife could be caused by the following actions:

- vegetation clearing (including trees), grading, excavating/trenching, placement of rock slope protection, and paving activities during construction;
- temporary stockpiling and sidecasting of soil, construction materials, or other construction wastes;
- soil compaction, dust, and water runoff from the construction site;
- short-term construction-related noise (from equipment); and

- degradation of water quality in drainages and wetlands, resulting from construction runoff containing petroleum products.

Indirect Effects

Indirect effects on wildlife could e caused by the following actions:

- permanently altering light and noise levels;
- altering hydrology;
- causing damage through toxicity associated with herbicides, insecticides, and rodenticides;
- introducing pet and human disturbance (including trash dumping);
- increasing habitat for native competitors or predators; and
- introducing invasive non-native species.

5.12.2.2 Determination of Effects

For this analysis, an effect pertaining to wildlife resources was considered significant if it would result in any of the following environmental effects, which are based on professional practice and State CEQA Guidelines Appendix G (14 CCR 15000 *et seq.).*

- have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by DFG or the USFWS;
- interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance;
- conflict with the provisions of an adopted habitat conservation plan, natural communities conservation plan, or other approved local, regional, or state habitat conservation plan; or
- contribute to a substantial reduction or elimination of species diversity or abundance.

Qualitative relationships between environmental conditions and life stage survival or wildlife resources are the basis of the effect assessment. Cause and effect relationships are identified for assessment species, including the relationship between environmental conditions and habitat, and the effects of changes in habitat on survival.

The mitigation measures described for potential effects on sensitive biological resources have not been developed through formal consultation or coordination with resource agencies (e.g., DFG, USFWS, NMFS, and the USACE). As part of the environmental analysis for the project, WSAFCA will contact agencies as part of the environmental compliance process to determine specific compensatory mitigation for effects on wetlands, state- and federally listed species, and riparian habitats. Additional mitigation measures may also be identified as conditions of future action permits (e.g., a BO, Section 7 Incidental Take Statement, or Section 1602 Streambed Alteration Agreement).

5.12.3 Effects and Mitigation Measures

5.12.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects on wildlife, such as displacement or loss of habitat would occur.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to seepage or slope stability/geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Wildlife program analysis (Section 3.10.3.3.1). In summary, these effects could include the physical displacement, mortality, or destruction of habitat for a significant number of special-status species.

Compliance with USACE's levee vegetation guidance could result in the removal of a substantial amount of vegetation, including vegetation that comprises mature oak woodland and supports wildlife populations (including special-status species). This effect could be considered significant.

5.12.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on wildlife resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (VELB)	Less than significant	N/A	
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Western Pond Turtle)	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel VEG-MM-5: Install Construction Barrier Fencing to Protect Sensitive Biological Resources Adjacent to the Construction Zone WILD-MM-1: Document Special-Status Species and Their Habitats WILD-MM-2: Redesign the Action to Protect Special-Status Wildlife Habitat and Develop a Mitigation Monitoring Plan
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Swainson's Hawk)	Significant	Less than Significant	VEG-MM-1: Compensate for the Disturbance or Removal of Riparian Habitat WILD-MM-3: Coordinate with Resource Agencies and Develop Appropriate Wildlife Compensation Plans for Species Listed under ESA or CESA

Effect	Finding	With Mitigation	Mitigation Measure
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Other Special-Status Birds)	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel WILD-MM-4: Avoid or Minimize Construction-Related Effects on Nesting Birds
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Burrowing Owl)	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel WILD-MM-2: Redesign the Action to Protect Special-Status Wildlife Habitat and Develop a Mitigation Monitoring Plan WILD-MM-3: Coordinate with Resource Agencies and Develop Appropriate Wildlife Compensation Plans for Species Listed under ESA or CESA
WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Bats and Bat Roosts)	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel WILD-MM-5: Conduct a Preconstruction Survey for Roosting Bats and Avoid or Mitigate Potential Effects
WILD-3: Disturbance or Loss of Common Wildlife Species as a Result of Construction (Migratory Birds)	Significant	Less than significant	VEG-MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel WILD-MM-4: Avoid or Minimize Construction-Related Effects on Nesting Birds
WILD-3: Disturbance or Loss of Common Wildlife Species as a Result of Construction (Other Common Species)	Less than significant	N/A	N/A
WILD-4: Disruption of Wildlife Movement Corridors as a Result of Construction	Less than significant	N/A	N/A

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (VELB)

In the study area, elderberry shrubs occur in the Sacramento River riparian corridor adjacent to the project construction limit. As shown in Table 5.12-3, below, and Figure 5.12-1, a total of 22 shrubs or shrub clusters are located within 100 feet of the project construction limit.

Complete avoidance of effects on VELB is assumed when a 100-foot buffer (from construction) is established around elderberry shrubs. Direct effects on VELB may generally occur when construction occurs within 20 feet of elderberry shrubs. Indirect effects on VELB may generally occur if elderberry shrubs are located from 20 to 100 feet of construction. There are no shrubs located within 20 feet of the construction limit. As shown in Table 5.12-3, 22 shrubs are located between 20 and 100 feet of the construction limit.

Table 5.12-3. Elderberry Shrub Survey Results—Riparian

Elderberry Shrub/Cluster Number	Number of Stems > 1 Inch and < 3 Inches	Number of Stems > 3 Inches and < 5 Inches	Number of Stems > 5 Inches	Total Number of Stems	Exit holes N/Y

Total	**173**	**19**	**3**	**192**	**N/A**

WSAFCA has coordinated with the USFWS and agreed to protective measures for these shrubs. The following measures will be implemented to avoid and minimize effects to VELB:

- Before ground disturbance, all construction personnel will participate in a USFWS-approved worker environmental awareness program. A qualified biologist approved by the USFWS will inform all construction personnel about the life history of VELB and the importance of its host shrub, the elderberry. Proof of this instruction will be submitted to the USFWS.
- Protective buffer areas will be created for elderberry shrub clusters by the installation of approximately 1500 feet of K-rail fencing along the edge of the construction zone (See Figure 5-2). In the eastern portion of the project area, there are shrubs that lie within existing tree canopy. To protect these shrubs and avoid potentially damaging existing trees, an approximate 80-foot semi-circle of orange construction fencing will be installed adjacent to the construction zone in this portion of the study area (see Figure 5-2). Within buffer areas, signs will be posted along fencing for the duration of construction. The signs will contain the following information:

This area is habitat of the valley elderberry longhorn beetle, a threatened species, and must not be disturbed. This species is protected by the Endangered Species Act of 1973, as amended. Violators are subject to prosecution, fines, and imprisonment.

- Buffer area fences around elderberry shrubs/clusters will be inspected weekly by a qualified biologist during ground-disturbing activities and monthly after ground-disturbing activities until project construction is complete or until the fences are removed, as approved by the biological monitor and the resident engineer. The biological monitor will be responsible for ensuring that the contractor maintains the buffer area fences around elderberry shrubs throughout construction. Biological inspection reports will be provided to the project lead and USFWS.
- WSAFCA will ensure that the project site will be watered down as necessary to prevent dust from becoming airborne and accumulating on elderberry shrubs in and adjacent to a project site.

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Western Pond Turtle)

Although western pond turtle is not currently known to occur in the study area, there is potential for this species to utilize the riparian corridor adjacent to the Sacramento River for winter hibernacula and nesting. However, construction at the project area is designed to avoid the Sacramento River riparian corridor, thus avoiding effects on this species. Implementation of Mitigation Measures VEG-MM-4, VEG-MM-5, WILD-MM-1 and WILD-MM-2 would further ensure that this species would not be affected. This effect would be less than significant.

Mitigation Measure VEG--MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel

Mitigation Measure VEG-MM-5: Install Construction Barrier Fencing to Protect Sensitive Biological Resources Adjacent to the Construction Zones

Mitigation Measure WILD-MM-1: Document Special-Status Wildlife Species and Their Habitat

WSAFCA will retain a qualified wildlife biologist to document the presence or absence of suitable habitat for special-status wildlife. The following steps will be implemented to document special-status wildlife and their habitats:

- **Review existing information**. The wildlife biologist will review existing information to develop a list of special-status wildlife species that could occur in the action area. The following information will be reviewed as part of this process: the USFWS special-status species list for the action region, DFG's CNDDB, previously prepared environmental documents, city and county general plans, habitat conservation plans and natural community conservation plans (if there are any adopted by the time the action is constructed), and USFWS-issued BOs for previous actions.
- **Coordinate with state and Federal agencies**. The wildlife biologist will coordinate with the appropriate agencies (DFG and USFWS) to discuss wildlife resource issues in the action region and determine the appropriate levels of survey necessary to document special-status wildlife and their habitats.
- **Conduct field studies**. The wildlife biologist will evaluate existing habitat conditions and determine what levels of biological survey may be required. The type of survey required will

depend on species richness, habitat type and quality, and the probability of special-status species occurring in a particular habitat type. Depending on the existing conditions in the action area and the proposed construction activity, one or a combination of the following levels of survey may be required:

- **Habitat assessment.** A habitat assessment determines whether suitable habitat is present. This type of assessment can be conducted at any time of year and is used to assess and characterize habitat conditions and determine whether return surveys are necessary. If no suitable habitat is present, no additional surveys will be required.
- **Conduct species-focused surveys.** Species-focused surveys (or target species surveys) will be conducted if suitable habitat is present for special-status wildlife and it is necessary to determine the presence or absence of the species in the action area. The surveys will focus on special-status wildlife species that have the potential to occur in the region. The surveys will be conducted during a period when the target species are present and/or active.
- **Conduct protocol-level wildlife surveys.** The program proponent will comply with protocols and guidelines issued by responsible agencies for certain special-status species. USFWS and DFG have issued survey protocols and guidelines for several special-status wildlife species that could occur in the study area, including (but not limited to) VELB, Swainson's hawk, western burrowing owl, and giant garter snake. The protocols and guidelines may require that surveys be conducted during a particular time of year and/or time of day when the species is present and active. Many survey protocols require that only a USFWS- or DFG-approved biologist perform the surveys. The program proponent will coordinate with the appropriate state or Federal agency biologist before initiation of protocol-level surveys to ensure that the survey results will be valid. Because some species can be difficult to detect or observe, multiple field techniques may be used during a survey period, and additional surveys may be required in subsequent seasons or years as outlined in the protocol or guidelines for each species.

Mitigation Measure WILD-MM-2: Redesign the Action to Protect Special-Status Wildlife Habitat and Develop a Mitigation Monitoring Plan

Preconstruction surveys for western pond turtles in suitable aquatic habitat and associated upland areas will be conducted by a qualified biologist 2 weeks before and 24 hours prior to the start of construction activities. A survey will consist of three visits within a 2-week period, preferably during the appropriate time of year (March through October) and day (early morning) to maximize the chances of observing a turtle.

If a turtle is located within 100 feet of the construction limit, exclusion fencing will be installed to prevent turtles from entering the construction area. If a turtle is observed in the construction area during construction, it will be allowed to move out of this area on its own or, if necessary, be relocated out of this area (with authorization from the DFG), and exclusion fencing will be installed to prevent the movement of turtles back into the construction area. Additionally, the construction area will be clearly defined, using orange barrier fencing, to minimize disturbance to riparian vegetation which could be utilized by western pond turtle as upland habitat.

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Swainson's Hawk)

Tree and shrub removal, other vegetation clearing, grading, and other construction activities conducted during the nesting season (generally February 15 through August 31) could remove or cause abandonment of active nests of Swainson's hawk.

In the study area, suitable Swainson's hawk foraging habitat occurs in grassland areas within and adjacent to the Sacramento North Levee. There are 7.79 acres of grasslands on the levee itself and 3.07 acres of grasslands proposed for project staging. It is assumed that grassland areas within the project staging area would be temporarily disturbed during construction but would be reseeded, if needed, and returned to preproject conditions following construction. Within the levee area, recreational trails proposed as part of the recreational project element would result in permanent loss of grasslands, while areas outside of recreational project components would be reseeded and returned to grassland. Although the exact loss of grassland area is not yet known, the loss is assumed to be no more than 5 acres.

A Swainson's hawk nest has been reported in a cottonwood tree on the opposite side of the Sacramento River from the study area. Pursuant to a site visit with USFWS and CDFG representatives in December 2009, the Sacramento River presents a visual barrier from this nest and project activities that occur during the nesting season (generally February 15 through August 31) are unlikely to adversely affect activities within that nest (should the nest be in use). Construction of the project would require removal of up to one acre of riparian habitat, either directly or through habitat removal. Tree and shrub removal, other vegetation clearing, grading, and other construction activities conducted during the nesting season (generally February 15 through August 31) could remove or cause abandonment of active nests of Swainson's hawk.

To avoid and minimize effects to Swainson's hawk, WSAFCA representatives coordinated with DFG representatives during a field visit in December 2009 and agreed to implement the following measures:

- If a nest is found to occur within or adjacent to the study area on the western side of the Sacramento River, before ground disturbance, all construction personnel will participate in a CDFG-approved worker environmental awareness program. A qualified biologist will inform all construction personnel about the life history of Swainson's hawk and the importance of nest sites and foraging habitat.
- A breeding season survey for nesting birds will be conducted for all trees and shrubs that will be removed or disturbed which are located within 500 feet (0.5 mile for Swainson's hawk) of construction activities, including grading. Swainson's hawk surveys will be completed during at least two of the following survey periods: January 1 to March 20, March 20 to April 5, April 5 to April 20, and June 10 to July 30 with no fewer than three surveys completed in at least two survey periods, and with at least one of these surveys occurring immediately prior to project initiation (Swainson's Hawk Technical Advisory Committee 2000). Other migratory bird nest surveys can be conducted concurrent with Swainson's hawk surveys with at least one survey to be conducted no more than 48 hours from the initiation of project activities to confirm the absence of nesting. If the biologist determines that the area surveyed does not contain any active nests, construction activities, including removal or pruning of trees and shrubs, can commence without any further mitigation.

- If active nests are found, WSAFCA will maintain a 0.25-mile buffer between construction activities and the active nest(s). In addition, a qualified biologist will be present on-site during construction activities to ensure the buffer distance is adequate and the birds are not showing any signs of stress. If signs of stress that may cause nest abandonment are noted, construction activities will cease until a qualified biologist determines that fledglings have left an active nest.

Swainson's hawk is a state-listed species protected under the MBTA and CFGC; therefore, these effects are considered significant. Implementation of the above-described protection measures and Mitigation Measures VEG-MM-1and WILD-MM-3would reduce this effect to less than significant.

Mitigation Measure VEG-MM-1: Compensate for the Loss of Woody Riparian Habitat

Mitigation Measure WILD-MM-3: Coordinate with Resource Agencies and Develop Appropriate Wildlife Compensation Plans for Species Listed under ESA or CESA

According to DFG's *Staff Report Regarding Mitigation for Impacts to Swainson's Hawks in the Central Valley,* loss of Swainson's hawk foraging habitat shall be mitigated for at a specified ratio that depends on the distance between the project area and the nearest active nest site (California Department of Fish and Game 1994). In accordance with these guidelines, loss of foraging habitat within a 1-mile radius is to be compensated at a ratio of 1:1, loss of habitat within 1 to 5 miles at a ratio of 0.75:1, and loss of habitat within 5 to 10 miles at a ratio of 0.5:1 (California Department of Fish and Game 1994). Loss of foraging habitat in the study area would be compensated at a ratio of 1:1. Compensation can be carried out by providing off-site habitat management lands as described in the DFG's (1994) guidelines or by purchasing credits at a local, DFG- approved mitigation bank.

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Their Habitats as a Result of Construction (Other Special-Status Birds)

Several other special-status birds have potential to nest in or adjacent to the study area based on reported occurrences within a 10-mile radius. These species include white-tailed kite, northern harrier, loggerhead shrike, and purple martin.

These species are not reported to nest in the study area but are known to nest in the vicinity. Riparian forest and landscape tree areas adjacent to the construction area contain suitable nesting habitat for white-tailed kite and purple martin. Open grassland areas containing scattered shrubs and trees provide suitable nesting habitat for loggerhead shrike. Grasslands in and adjacent to the study area provide low quality nesting habitat for northern harrier.

Tree and shrub removal, other vegetation clearing, grading, or other construction activities conducted during the nesting season (generally February 15 through August 31) could remove or cause abandonment of active nests of special-status birds, including species of special concern (loggerhead shrike, northern harrier, and purple martin) and fully protected species (white-tailed kite), and other migratory birds protected under the MBTA and CFGC. Therefore, these effects would be considered significant. Implementation of Mitigation Measures Veg-4 and WILD-MM-4 would reduce this effect to less than significant.

Mitigation Measure VEG--MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel

Mitigation Measure WILD-MM-4: Avoid or Minimize Construction-Related Effects on Nesting Birds

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Non-Special-Status Migratory and Their Habitats as a Result of Construction (Western Burrowing Owl)

Burrowing owl is reported to nest 0.5 mile south of the study area. Burrowing owls have potential to nest in grasslands and unvegetated areas along levees throughout the study area. Construction activities, including grading and clearing activities within and adjacent to occupied lands could result in nesting failure, death of nestlings, or loss of eggs. Effects on a state species of special concern and species protected under the MBTA and CFGC are considered significant. Implementation of Mitigation Measures VEG-MM-4, WILD-MM-2, and WILD-MM-3would ensure that project activities would not result in nesting disturbance or habitat loss for this species and reduce this effect to less than significant.

Mitigation Measure VEG--MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel

Mitigation Measure WILD-MM-2: Redesign the Action to Protect Special-Status Wildlife Habitat and Develop a Mitigation Monitoring Plan

In conformance with Federal and state regulations regarding the protection of raptors, a preconstruction survey for burrowing owls will be completed, in accordance with DFG guidelines described in the *Staff Report on Burrowing Owl Mitigation*, prior to the start of construction within suitable habitat and (where possible) in areas within 500 feet of the construction zone. Surveys should be conducted during the wintering (December 1 through January 31 recommended) and nesting (April 15 through July 15 recommended) seasons. Surveys should be conducted from 2 hours before sunset to 1 hour after, or from 1 hour before or 2 hours after sunrise. If no burrowing owls are located during these surveys, no additional action would be warranted. However, if breeding or resident owls are located on or immediately adjacent to the site, the following measures will be implemented.

- No burrowing owls will be evicted from burrows during the nesting season (February 1 through August 31). Eviction outside the nesting season may be permitted pending evaluation of eviction plans and receipt of formal written approval from the DFG authorizing the eviction.
- A 250-foot buffer, within which no new activity would be permissible, would be maintained between project activities and nesting burrowing owls. This protected area would remain in effect until August 31, or at the DFG's discretion and based on monitoring evidence, until the young owls are foraging independently.
- If accidental take (disturbance, injury, or death of owls) occurs, the DFG would be notified immediately.

Mitigation Measure WILD-MM-3: Coordinate with Resource Agencies and Develop Appropriate Wildlife Compensation Plans for Species Listed under ESA or CESA

If a preconstruction survey finds that burrowing owls occupy a project area, and occupied habitat will be converted to unsuitable habitat, habitat compensation on off-site mitigation lands will be implemented. Habitat management lands comprising existing burrowing owl foraging and breeding habitat will be acquired and preserved. An area of 6.5 acres (the amount of land found to be necessary to sustain a pair or an individual owl) will be secured for each pair of owls or for an individual, in the case of an odd number of birds.

Where construction would only temporarily modify occupied habitat but habitat value would return to the preproject condition, compensation would not be required.

Effect WILD-2: Disturbance or Loss of Special-Status Wildlife Species and Non-Special-Status Migratory and Their Habitats as a Result of Construction (Bats and Bat Roosts)

Pallid bat, hoary bat and western red bat have potential to roost in riparian forest habitat adjacent to the project area. Bat roosts of special-status species and non- special-status species are highly sensitive to disturbance and are considered a sensitive resource by DFG. Construction activities such as tree removal and trimming or construction noise could result in impacts on roosting bats, including the destruction of active roosts, the loss of individuals, or roost failure. In addition, nighttime construction activities could disturb bats emerging from nearby roosts resulting in the disruption of foraging activities. These effects could be considered significant if the subsequent population decline was large and affected the viability of the local populations of bats. Implementation of Mitigation Measures VEG-MM-4 and WILD-MM-5 would reduce this potential effect to less than significant.

Mitigation Measure VEG--MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel

Mitigation Measure WILD-MM-5: Conduct a Preconstruction Survey for Roosting Bats and Avoid or Mitigate Potential Effects

Prior to any tree trimming and removal or other construction activities, a qualified biologist should conduct a preconstruction survey to determine whether bats are present. The survey should consist of a nighttime emergence survey of suitable trees for evidence (presence of guano or urine stains) of use by bats, and it should be conducted no more than 14 days prior to construction activities. If the biologist determines that the area surveyed does not contain any active roosts, activities may commence without any further mitigation. If active roosts are found, roosting structures should be retained, and the need for a construction buffer should be determined through consultation with DFG. If avoidance is not possible, DFG may require that bats be excluded from the habitat prior to start of the breeding and/or hibernation season. Compensatory mitigation for the loss of roosting habitat also should be determined through consultation with DFG but may include the construction and installation of suitable replacement habitat on site.

Effect WILD-3: Disturbance or Loss of Common Wildlife Species as a Result of Construction (Migratory Birds)

Numerous non-special-status migratory bird species also have potential to nest in and adjacent to the construction area. Examples of these include red-tailed hawk, red-shouldered hawk, great horned owl, and American kestrel.

Tree and shrub removal, other vegetation clearing, grading, or other construction activities conducted during the nesting season (generally February 15 through August 31) could remove or cause abandonment of active nests of migratory birds protected under the MBTA and CFGC. Therefore, these effects would be significant. Implementation of Mitigation Measures VEG-MM-4 and WILD-MM-4 would reduce this effect to less than significant.

Mitigation Measure VEG--MM-4: Conduct Mandatory Contractor/Worker Awareness Training for Construction Personnel

Mitigation Measure WILD-MM-4: Avoid or Minimize Construction-Related Effects on Nesting Birds

Effect WILD-3: Disturbance to or Loss of Common Wildlife Species as a Result of Construction (Other Common Species)

The study area contains both natural and constructed habitats that support numerous common species. These species include a wide variety of terrestrial invertebrates, birds and raptors, amphibians, reptiles, and mammals. Although nesting migratory birds and bats would be protected from nesting disturbance through implementation of Mitigation Measure WILD-MM-1, WILD-MM-2, and WILD-MM-5, other species may be harmed or killed during construction. Other than nesting migratory birds and bats, other common wildlife species are not afforded protection under CEQA or NEPA because they are considered to be widespread and abundant. Effects on these species are therefore considered to be less than significant. No mitigation is required.

Effect WILD-4: Disruption of Wildlife Movement Corridors as a Result of Construction

In the study area, the riparian forest adjacent to the Sacramento River is considered to be a major movement corridor. Although construction has been designed to avoid impacts to this corridor, the construction site, particularly the Sacramento North Levee, may also be used as a movement corridor for wildlife due to its proximity to the Sacramento River. During construction of levee improvements, movement through the project area would be temporarily impeded by the placement of physical barriers (fencing) used to protect resources outside of the construction footprint but movement would be restored to the pre-project condition following construction. Therefore, disruption of movement through the project area is less than significant. No mitigation is required.

5.12.3.3 The Rivers Alternative B

With respect to wildlife resources, the construction corridor and construction-related effects associated with The Rivers Alternative B are the same as those described above for The Rivers APA. In the interest of brevity, effects discussions and mitigation measures are not repeated here.

Section 5.13
Land Use and Agriculture—The Rivers Early Implementation Project

5.13.1 Affected Environment

This section describes the affected environment for land use and agriculture in The Rivers EIP project area, including the regulatory and environmental setting.

5.13.1.1 Regulatory Setting

5.13.1.1.1 Federal

The following Federal policies related to land use and agriculture may apply to implementation of The Rivers EIP. Please see Section 3.11.2.1, Regulatory Setting, for a more complete description of each policy.

- Farmland Protection Policy Act
- Federal Farmland Designations

5.13.1.1.2 State

The following state policies related to land use and agriculture may apply to implementation of The Rivers EIP. Please see Section 3.1.2.1, Regulatory Setting, for a more complete description of each policy.

- Williamson Act

5.13.1.1.3 Local

The following local policies related to land use and agriculture may apply to implementation of The Rivers EIP. Please see Section 3.11.2.1, Regulatory Setting, for a more complete description of each policy.

- Delta Protection Commission
- *Yolo County General Plan*
- *City of West Sacramento General Plan*

5.13.1.2 Environmental Setting

This section discusses the environmental setting related to land use and agriculture in The Rivers EIP project area.

The proposed levee improvement would take place entirely within Yolo County and the City of West Sacramento, along the Sacramento River North Levee. The land in and adjacent to the project area

has been designated by the City of West Sacramento as public/quasi public, single-family residential, waterfront, recreation-parks, and public open space (City of West Sacramento 2009).

Residential areas are at the southwest and southeast corners of the project area. The residential area to the southwest is comprised of single-family homes. The residential area to the southeast is The Rivers gated community, also comprised of single family homes. The area that lies south of the 70+00 to 82+50 section of the project area is comprised of Bryte Park, which is designated as recreation-parks by the City of West Sacramento. The portion of the city that lies directly south of the 82+50 to 92+50 section of the project area is comprised of Riverbank Elementary School, which is designated as public-quasi public areas. Inside The Rivers gated community at the southeast corner of the project area, the land has been designated as waterfront. The area of the levee is designated as public open space (City of West Sacramento 2009).

No land in the project area has been designated as agricultural, nor is any land part of a Williamson Act contract.

5.13.2 Environmental Consequences

This section describes the environmental consequences relating to land use and agriculture for the proposed Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.11.3.3, Effects and Mitigation Measures.

5.13.2.1 Assessment Methods

This evaluation of land use and agriculture is based on a review of the regulatory setting above, review of the project in regard to compliance with Federal, state and local land use plans and regulations, and field observations. Key effects were identified and evaluated based on the environmental characteristics of The Rivers EIP project area and the magnitude, intensity, and duration of activities related to the construction and operation of this project.

5.13.2.2 Determination of Effects

For this analysis, an effect pertaining to land use and agriculture was analyzed under NEPA and CEQA if it would result in any of the following environmental effects, which are based on NEPA standards, State CEQA Guidelines Appendix G (14 CCR 15000 *et seq.*), and standards of professional practice.

For land use, an effect would:

- physically divide an established community;
- conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect; or
- conflict with any applicable habitat conservation plan or natural community conservation plan.

For agriculture, an effect would:

- convert prime farmland, unique farmland, or farmland of statewide importance;
- conflict with existing zoning for agricultural use, or a Williamson Act contract; or
- involve other changes in the existing environment, which because of their location or nature, could result in conversion of farmland to non-agricultural use.

5.13.3 Effects and Mitigation Measures

5.13.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects relating to land use and agriculture such as conversion of farmland or changes in land zoning would occur.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to seepage, slope stability or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Land Use program analysis (Section 3.11.3.3.1). In summary, these effects could include temporary and permanent reduction in agricultural productivity, conversion of land from its designated use, and physical division of established communities. In addition, if the Sacramento River North Levee were to fail, the Bryte and Rivers residential neighborhood, Bryte Park, and Riverbank Elementary School would be in the direct line of floodwaters.

5.13.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on land use and agriculture. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect LU-1: Temporary Changes in Land Uses to Accommodate Construction	Less than significant	N/A	N/A
Effect LU-2: Change in Land Use Designations or Potential to Conflict with Local Land Use Designations as a Result of Construction	Less than significant	N/A	N/A

Effect LU-1: Temporary Changes in Land Uses to Accommodate Construction

During construction of The Rivers APA, a staging area to house construction equipment and materials would be necessary (see Figure 5-1 for the location of the staging area). The staging and construction areas are zoned as Waterfront and Public Open Space by the City of West Sacramento (see Figure 3.11-1). These will be returned to their original uses following the completion of construction. Thus, The Rivers APA would not result in significant effects on land use as a result of temporary land use changes. This effect is considered less than significant. No mitigation is required.

A portion of the construction area encompasses 15 residences from which the residents will be temporarily relocated during construction. The effects associated with relocating these residents are discussed in Section 5.14, "Socioeconomic and Community Effects."

Effect LU-2: Change in land use Designations or Potential to Conflict with Local Land Use Designations as a Result of Construction

Implementation of The Rivers APA may require WSAFCA to acquire a permanent right-of-way in areas adjacent to the levee through fee title or easement interest within the footprint of the project improvements to prevent residential or utility encroachments into the flood control system. At the western end of the project area, the land is zoned as public/quasi-public, a zone that provides for government-owned facilities, public and private schools, and quasi-public uses such as hospitals and churches. The purpose of this zone is to provide for a broad range of public, quasi-public, and non-profit institutional uses. The proposed use in WSAFCA's acquired permanent right-of-way, flood infrastructure maintenance, would not conflict with current zoning and land use as the current use is recreation-park land. Additionally, 23 acres of land located on top of the levee (currently designated public open space) would be added to Bryte Park, resulting in a net gain in recreation-park land.

At the eastern end of the project area in The Rivers gated community, there are 11 residences located on top of the levee and four residences adjacent to the landside toe of the levee that encroach into the levee operation and maintenance area. The Rivers gated community is zoned as waterfront, a zone that provides for marinas, restaurants, retail, amusement, hotel, and motel uses, mid-rise and high-rise offices, multi-family residential units (which are oriented principally to the river), public and quasi/public uses, and similar and compatible uses. WSAFCA's acquisition of a permanent right of way within The Rivers gated community, would not conflict with current zoning, however, it may conflict with the current residential use. However, flood infrastructure maintenance could be considered a compatible use within the Waterfront zone. If property were to be acquired as a permanent right of way, the amount of land would affect a small percentage of the housing and residential use within The Rivers gated community and would not result in a loss substantial enough to divide the community.

In summary, the implementation of The Rivers APA would still be compatible with local land use designations because the public open space, public/quasi-public, and waterfront designations allow flood infrastructure maintenance uses. This effect would be less than significant. No mitigation is required.

5.13.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on land use and agriculture. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
LU-1: Temporary Changes in Land Uses to Accommodate Construction	Less than significant	N/A	N/A
Effect LU-2: Change in Land Use Designations or Potential to Conflict with Local Land Use Designations as a Result of Construction	Less than significant	N/A	N/A

Effect LU-1: Temporary Changes in Land Uses to Accommodate Construction

This effect is the same as described above under The Rivers APA. This effect is considered less than significant. No mitigation is required.

Effect LU-2: Change in land use Designations or Potential to Conflict with Local Land Use Designations as a Result of Construction

Implementation of The Rivers Alternative B may require WSAFCA to acquire a permanent right- of-way in areas adjacent to the levee through fee title or easement interest within the footprint of the project improvements to prevent residential or utility encroachments into the flood control system. At the western end of the project area, the land is zoned as public/quasi-public, a zone that provides for government-owned facilities, public and private schools, and quasi-public uses such as hospitals and churches. The purpose of this zone is to provide for a broad range of public, quasi-public, and non-profit institutional uses. The proposed use within WSAFCA's acquired permanent right of way, flood infrastructure maintenance, would not conflict with current zoning and land use as the current use is recreation-park land. Additionally, 23 acres of land located on top of the levee (currently designated public open space) would be added to Bryte Park, which would create a net gain in recreation-park land.

At the eastern end of the project area in The Rivers gated community, there are 11 residences located on top of the levee and four residences adjacent to the landside toe of the levee that encroach into the levee operation and maintenance area. The Rivers gated community is zoned as waterfront, a zone that provides for marinas, restaurants, retail, amusement, hotel, and motel uses, mid-rise and high-rise offices, multi-family residential units (which are oriented principally to the river), public and quasi/public uses, and similar and compatible uses. WSAFCA's acquisition of a permanent right-of-way in The Rivers gated community would not conflict with current zoning, but it may conflict with the current residential use. However, flood infrastructure maintenance could be considered a compatible use in the Waterfront zone. If property were to be acquired as a permanent right of way, the amount of land would affect a small percentage of the housing and residential use within The Rivers gated community and would not result in a loss substantial enough to divide the community.

In summary, the implementation of The Rivers Alternative B would still be compatible with local land use designations because the public open space, public/quasi-public, and waterfront designations allow flood infrastructure maintenance uses. This effect would be less than significant. No mitigation is required.

Section 5.14
Socioeconomic and Community Effects—The Rivers Early Implementation Project

5.14.1 Affected Environment

This section describes the affected environment for socioeconomics and the community in The Rivers EIP project area, including regulatory and environmental setting.

5.14.1.1 Regulatory Setting

The following policies related to socioeconomics and the community may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.12.2.1, Regulatory Setting, for a more complete description of the policy.

5.14.1.1.1 Federal

- Uniform Relocation Assistance and Real Property Acquisition Policies Act

5.14.1.1.2 State

- Relocation Assistance and Property Acquisition

5.14.1.1.3 Local

- *City of West Sacramento General Plan*

5.14.1.2 Environmental Setting

This section discusses the environmental setting related to socioeconomics and the community in The Rivers EIP study area. A regional socioeconomic and community setting for The Rivers EIP project area is described in the Program Area Affected Environment (Section 3.12.2.2). Additional details relevant to the analysis of socioeconomic and community effects at The Rivers EIP project area are described below.

5.14.1.2.1 Housing and Property

- There are 15 residences in the immediate vicinity of proposed construction activities under either of The Rivers EIP alternatives. During some periods of time, construction activities would be directly adjacent to these homes. In addition, the proposed utility modifications would result in the temporary disruption of service (water, telephone, electricity, gas and sanitary sewer) during construction.
- There are 11 residences located on top of the levee and four residences adjacent to the landside toe of the levee that encroach into the levee operation and maintenance area. Before construction, WSAFCA may acquire temporary or permanent right-of-way through fee title or

easement interest within the footprint of the project improvements to prevent residential or utility encroachments into the flood control system.

5.14.1.2.2 Employment

No land in agricultural production is located within or adjacent to The Rivers EIP project area that could be affected by implementation of either alternative.

As described in the setting section of Section 3.15, Recreation, some unofficial recreational activities, such as fishing, that may provide commerce for local recreation-related businesses (e.g., bait shops) occur on the vegetated waterside berm located adjacent to the levee at The Rivers EIP project area.

5.14.2 Environmental Consequences

This section describes the analysis of effects relating to socioeconomic and community conditions for The Rivers EIP. It describes the methods used to determine the effects of the proposed project and identifies the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.12.3.3, Effects and Mitigation Measures.

5.14.2.1 Assessment Methods

Effects on socioeconomics and the community were evaluated qualitatively based on the criteria listed below in Determination of Effects. Additionally, The Rivers EIP was evaluated for consistency with relevant local plans and policies at the Federal, state and local level.

5.14.2.2 Determination of Effects

For this analysis, an effect pertaining to socioeconomics and the community was analyzed under NEPA and CEQA if it would result in any of the following environmental effects, which are based on NEPA standards, State CEQA Guidelines Appendix G (14 CCR 15000 et seq.), and standards of professional practice:

- a substantial change in employment;
- inducement of substantial population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure); or
- displacement of substantial numbers of existing housing or people, necessitating the construction of replacement housing elsewhere.

5.14.2.2.1 Effect Assumptions

Although some unofficial recreational activities that may provide commerce for local recreation-related businesses occur on the vegetated waterside berm located adjacent to the levee at The Rivers EIP project area, there are abundant close-by alternate locations for the types of activities that may be potentially affected by project construction. The project-level recreation analysis found project-related effects on recreation to be less than significant. Employment at recreation-related

businesses is therefore not anticipated to be affected by project implementation, and is therefore not discussed further in this section.

5.14.3 Effects and Mitigation Measures

5.14.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects relating to socioeconomics or the community would occur and there would be no changes in existing population or employment, except for the changes currently planned for in the appropriate local and state planning documents. No displacement of existing residences to accommodate an expanded levee footprint for certain levee alternatives would occur. Therefore, there would be no effect on this resource under the No Action Alternative.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to under-seepage, slope stability, or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Socioeconomic and Community Effects program analysis (Section 3.12.4.1). To summarize the program analysis, should a levee failure and associated flooding occur at this site, there could be widespread temporary or permanent displacement of residents. Damages suffered from flooding could lead to the long-term disruption of industrial, agricultural and retail economic activities within the city of West Sacramento and within the greater Sacramento region. Dependent on the degree of damage caused, disruption of activities could lead to a reduction in employment and short- to long-term depressed economic conditions citywide resulting from damage to industrial, retail and agricultural facilities and major transportation facilities that support their activities. These effects on socioeconomic conditions would be significant. Post-flooding conditions could result in short-term increases in employment for post-flooding cleanup and restoration activities, but these increases would not likely offset the potential losses.

5.14.3.2 The Rivers Applicant Preferred Alternative—Slurry Wall and Landside Slope Flattening

Implementation of The Rivers APA would result in the following effects on socioeconomics and the community. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect SOC-1: Effects on Residents	Significant and unavoidable	N/A	N/A
Effect SOC-4: Temporary Increase in Employment in the Region during Construction	Beneficial	N/A	N/A

Effect SOC-1: Effects on Residents

Construction of The Rivers APA would be adjacent to 30 to 40 residences, would require temporary displacement of the occupants of approximately 15 residences, and may require easement or right-of-way acquisition. WSAFCA has committed to providing relocation services and compensation to the affected residents at The Rivers APA project area. WSAFCA would develop a Temporary Resident Relocation Plan, as described in Section 2.9 of Chapter 2, which would outline the process for providing notice for relocation, coordinating relocating activities, and providing security for homes that are vacated, among other issues related to temporary relocation. All acquisition and relocation services, as well as compensation for living expenses for temporarily relocated residents, would be provided in compliance with Federal and state relocation laws. No residents would be permanently displaced and no new construction would be necessary. However, because of the inconvenience to displaced residents, this effect is considered significant and unavoidable.

Effect SOC-4: Temporary Increase in Employment in the Region during Construction

As described in the Program Environmental Consequences, construction activities associated with implementation of The Rivers EIP would temporarily increase employment and personal income in the local area. Preliminary cost estimates anticipate that total construction-related expenditures associated with The Rivers APA would be approximately $15,000,000 to $25,000,000 (Vecchio pers. comm. 2009) in 2011. This is an estimate of direct costs only, and does not include indirect/induced changes in employment and personal income resulting from project construction. Project construction would benefit the local economy by temporarily increasing employment and personal income. Although the increase in employment is not considered substantial when compared to total employment in the region, this effect on employment would be beneficial.

5.14.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on socioeconomics and the community. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect SOC-1: Effects on Residents	Significant and unavoidable	N/A	N/A
Effect SOC-4: Temporary Increase in Employment in the Region during Construction	Beneficial	N/A	N/A

Effect SOC-1: Effects on Residents

Construction of The Rivers Alternative B would require temporary displacement of the occupants of 15 residences, and may require easement or right-of-way acquisition. WSAFCA has committed to providing relocation services and compensation to the affected residents at The Rivers APA project area. WSAFCA would develop a Temporary Resident Relocation Plan, as described in Section 2.9 of Chapter 2, which would outline the process for providing notice for relocation, coordinating relocating activities, and providing security for homes that are vacated, among other issues related to temporary relocation. All acquisition and relocation services, as well as compensation for living expenses for temporarily relocated residents, would be provided in compliance with Federal and

state relocation laws. No residents would be permanently displaced and no new construction would be necessary. However, because of the inconvenience to displaced residents, this effect is considered significant and unavoidable.

Effect SOC-4: Temporary Increase in Employment in the Region during Construction

Construction-related expenditures associated with The Rivers Alternative B have not been calculated, but are anticipated to be similar to the numbers presented for The Rivers APA, although construction would take place over 2 years instead of 1. Project construction would benefit the local economy by temporarily increasing employment and personal income. Although the increase in employment is not considered substantial when compared to total employment within the region, this effect on employment would be beneficial.

Section 5.15
Environmental Justice—The Rivers Early Implementation Project

5.15.1 Affected Environment

This section describes the affected environment for environmental justice in The Rivers EIP project area, including regulatory and environmental setting.

5.15.1.1 Regulatory Setting

5.15.1.1.1 Federal

The following Federal policy related to environmental justice may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.13.2.1, Regulatory Setting, for a more complete description of each policy.

- Federal Executive Order 12898, Environmental Justice

5.15.1.1.2 State

The following state policies related to environmental justice may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.13.2.1, Regulatory Setting, for a more complete description of each policy.

- State of California environmental justice regulations passed in 2001. These laws define environmental justice as "the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies."

5.15.1.2 Environmental Setting

This section discusses the environmental setting related to environmental justice in The Rivers EIP project area.

5.15.1.2.1 Study Area Demographics

The study area is in the city of West Sacramento, in Yolo County. For comparison, the same demographic information presented for West Sacramento is also presented for Yolo County and the State of California.

5.15.1.2.2 Local Setting

In 2000, Caucasians and Asians made up the largest two populations in the state, accounting for 59.5% and 10.9% of the population, respectively, while 16.8% of respondents claimed "other race." Those of Hispanic origin made up 32.4%, almost one-third of the State's population (U.S. Census 2008).

In 2000, Caucasians and Asians made up the largest two populations in Yolo County, accounting for 67.7and 9.9% respectively, while 13.8% of respondents claimed "other race." Those of Hispanic origin made up 25.9% of Yolo County (U.S. Census 2008).

In 2000, Caucasians and Asians made up the largest two populations in the city of West Sacramento accounting for 65% and 7.2% of the population respectively, while 16% claimed "other race." Those of Hispanic origin made up 30% of the city (U.S. Census 2008). Table 5.15-1 compares data regarding race in the study area in 2000 and 2005. Table 5.15-2 compares the household poverty status by city, county, and state.

Table 5.15-1. Race/Origin Characteristics by City/County/State, 2000 and 2005

	2000			2005		
	City of West Sacramento (percentage)	Yolo County (percentage)	State of California (percentage)	City of West Sacramento (percentage)	Yolo County (percentage)	State of California (percentage)
Race						
White	65.0	67.7	59.5	65.0	67	59.5
Black or African American	2.6	2	6.7	2.6	2	6.7
American Indian and Alaska Native	1.8	1.2	1.0	1.8	1	1.0
Asian	7.2	9.9	10.9	7.2	11	10.9
Native Hawaiian, other Pacific Islander	0.6	0.3	0.3	0.6	0.08	0.3
Some Other Race	16.0	13.8	16.8	16.0	12	16.8
Two or more races	6.9	5.2	4.7	6.9	5	4.7
Origin						
Hispanic	30.0	25.9	32.4	30.0	27.8	32.4

Table 5.15-2. Household Poverty Status by City/County/State, 2000

City	City of West Sacramento	Yolo County	State of California
Percent below poverty level	22.3	18.4	14.2

Source: U.S. Census Bureau 2000; California Employment Development Department 2000.

5.15.2 Environmental Consequences

This section describes the environmental consequences relating to environmental justice for The Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.13.3.3, Effects and Mitigation Measures.

5.15.2.1 Assessment Methods

The population data that are pertinent to the analysis of environmental justice include race, income, and age characteristics such as:

- the percent of minority population (Black or African American, American Indian and Alaskan Native, Asian, Native Hawaiian and Other Pacific Islander, some other race, and two or more races);
- the percent of persons of Hispanic origin;
- the percent of population below the poverty level; and
- the percent of population residing below the U.S. Census Bureau poverty threshold, defined as a single person with an income below $8,840, or a family of four with an income below $16,588.

Proposed project environmental justice effects were analyzed by comparing census data from the local setting and regional setting with data for the State of California.

5.15.2.2 Determination of Effects

Effects pertaining to environmental justice were considered significant if the project would result in a disproportionate effect on minority or low-income communities.

5.15.3 Effects and Mitigation Measures

5.15.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to seepage or slope stability/geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Environmental Justice program analysis (Section 3.13.3.3.1). In summary, a catastrophic flood event would likely affect populations of all income and ethnic classifications and would not result in a disproportionately high or significant effect on minority or low-income populations.

5.15.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effect on environmental justice. A description of this effect is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect EJ-1: Disproportionate Effect on Minority or Low-Income Populations	No effect	N/A	

Effect EJ-1: Disproportionate Effect on Minority or Low-Income Populations

The Rivers APA would reduce the risk of flooding to existing residential, commercial, and industrial development in the WSAFCA service area. While there are low-income and minority populations present throughout the study area, the flood protection benefits of the project would reach all segments of the population in the city of West Sacramento.

Construction-related environmental effects (e.g. exposure to noise, dust, and traffic) may occur in and around the project site, but the effects would be temporary and the neighborhood near The Rivers APA is largely affluent. There would be no disproportionate effects to low-income or minority populations. Some residents would be temporarily displaced during construction (this effect is discussed in Section 5.14, "Socioeconomic and Community Effects"); however, the residents who would be displaced are not disproportionately low-income or minority.

There is a known vagrant population that camps along the Sacramento River near The Rivers APA. The project could displace this population during construction activities. Increased recreational use of these areas as a result of the APA's recreation improvements may deter camping activity. However, there is not enough data about this population to make conclusions about the amount of people displaced. In addition, any loitering or camping along the river corridor is unlawful.

The Rivers APA would not result in a significant disproportionate effect on minority or low-income populations.

5.15.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effect on environmental justice. A description of this effect is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect EJ-1: Disproportionate Effect on Minority or Low-Income Populations	No effect	N/A	

Effect EJ-1: Disproportionate Effect on Minority or Low-Income Populations

This effect is the same as described above under The Rivers APA. The Rivers Alternative B would not result in a significant disproportionate effect on minority or low-income populations.

Section 5.16
Visual Resources—
The Rivers Early Implementation Project

5.16.1 Affected Environment

This section describes the affected environment for visual resources in The Rivers EIP project area, including regulatory and environmental setting.

5.16.1.1 Regulatory Setting

5.16.1.1.1 Local

The following local policies related to visual resources may apply to implementation of The Rivers EIP. Please see Section 3.14.2.1, Regulatory Setting, for a more complete description of each policy.

- *City of West Sacramento General Plan*
- *Yolo County General Plan*

5.16.1.2 Environmental Setting

This section discusses the environmental setting related to visual resources in The Rivers EIP project area. Definitions of concepts and terminology related to visual resources, such as visual quality, viewer exposure and sensitivity, and visual character that pertain to this study area are outlined in the Program Area Affected Environment.

5.16.1.2.1 Study Area

The study area for The Rivers EIP is the northern-most point of the Sacramento River North Levee. The study area is described in detail in the Program Affected Environment, Sacramento River North Levee section. Details pertinent to The Rivers EIP project area are provided below.

The Rivers EIP study area is at the northern tip of the City of West Sacramento boundary, directly west of the Sacramento River's confluence with the American River and east of the Sacramento Bypass Levee. The area is urbanized and has commercial and industrial developments, residential communities, educational facilities, open space, and riparian corridors.

The eastern most portion of The Rivers EIP project area is inside a newer gated development built in the last decade called The Rivers Community. Homes in this community are large two-story structures with small lots and have not been designed to meld with the older communities of Bryte and Broderick to the south, with respect to layout, architectural style, and streetscaping, yet it is speckled with mature oaks and other trees that were left to remain growing on certain properties. Some of the homes were constructed on the crown of the levee, while others are only separated by the project area by a small thoroughfare. Homes built atop the levee are adjacent to mature vegetation that lines the Sacramento River throughout the project area (Figure 5.16-1, Photo 1).

The southern border of the project area is bounded by the older residential homes comprising the Bryte and Broderick areas, west of The Rivers Community. The western-most end of the project area is bounded by Riverbank Elementary School, Bryte Park, and Alice Norman Playfields that are adjacent to the levee. In addition, the Lighthouse Golf Course is located adjacent to the levee, between the middle school and The Rivers Community.

The Sacramento River corridor creates a noticeable contrast to the surrounding, predominantly suburban area. Most views from the project area are limited to the foreground by bends in the river, vegetation, and development. The visual quality of the area is moderately unified because the landscape is fairly congruent and harmonious in terms of scale, color, and form. The inherent scenic qualities presented by a naturalized, accessible river corridor in a highly developed area result in a vividness that is moderately high. The presence of development and infrastructure surrounding this corridor results in a study area that is moderate in intactness and unity.

At the street level, viewers have foreground views of the levee and mature riparian trees, with little to no middleground and background views (Figure 3.14-2a, Photo 4). While atop the levee, foreground views to the southeast extend over open space playing fields toward background views of the downtown Sacramento skyline (Figure 5.16-1, Photo 2). While atop the levee looking due east and west, viewers have foreground views of only the levee crown with riparian vegetation to the north lining the levee (Figure 5.16-1, Photo 3).

5.16.1.2.2 Viewer Groups

The primary viewer groups in The Rivers study area are persons living or conducting business near this area, such as those living in The Rivers Community; travelers using local roads (including those on levee crowns); and recreationists (boaters, and fishermen on the Sacramento River; bicyclists; joggers). Primary viewer groups also include educators, students, and parents associated with Riverbank Elementary School. These groups have direct views of the project area described above.

Residents

Suburban residents are located directly adjacent to The Rivers EIP study area, or are separated from the project area by local streets. Some homes located on Rivercrest Drive are atop the levee crown. Suburban residences mostly are oriented inward toward the developments, and only residences on the outer edge of the developments have middleground and background views of levees. The residents in the project vicinity are likely to have a high sense of ownership over their adjacent waterways, the open space that surrounds them and their inherent scenic quality. Because of their potential exposure to such views, short distance from the study areas, and sense of ownership, these residents are considered to have high sensitivity to changes in the project area viewshed.

Businesses

Within the vicinity of The Rivers EIP project area there are residential and educational facilities which people frequent daily. Most persons within these facilities have semipermanent views from their respective facilities of the project area; however, some, such as those who work from their home located in the project area, have permanent views of the area. Situated in different locations throughout the study areas, these facilities' views range from views limited by the levees to sweeping views that extend out to the background. Users of these facilities are likely to be occupied with their work activities and tasks at hand.

Photo 1: Looking northeast atop the levee crown. Note the fence delineating the property line of a home located on the levee crown to the right of the photo and the riparian vegetation lining the levee in the foreground.

Graphics/Projects/00875.07/ WSac Program EIR/EIS-EIR/Visual (08-09) SS

Figure 5.16-1
The Rivers–Photo 1

Photo 2: Looking southwest from atop the levee, across the Bryte Park playing fields and the Bryte and Broderick neighborhoods, toward the downtown Sacramento skyline in the background.

Graphics/Projects/00875.07/ WSac Program EIR/EIS-EIR (08-09) SS

Figure 5.16-1
The Rivers–Photo 2

Photo 3: Looking due east from atop the levee crown, west of The Rivers community. Note the very wide levee crown, and the row of riparian vegetation in the middleground to the north.

Graphics/Projects/00875.07/ WSac Program EIR/EIS-EIR/Visual (08-09) SS

Figure 5.16-1
The Rivers–Photo 3

Because of their limited viewing times traveling to and from work and their focus on tasks at hand, this viewer group is considered to have moderate sensitivity to changes in views.

Roadway Users

Roadway users' vantages differ based on the roadway they are traveling and elevation of that roadway. The majority of views at the project area are mostly limited to the foreground by suburban, commercial, and industrial development; vegetation; and the levees themselves. Views to the middleground and background, including of the Sacramento River, are present but are limited to areas where structures that would otherwise conceal background views from the roadway, such as homes, are set back and where there is limited vegetation along the river corridor.

Travelers use roadways in the project area at varying speeds based on the traveler's familiarity with the route and roadway conditions (i.e., presence or absence of rain). Speed can be expected to be minimal near the project area as most of the roadways are in residential areas and/or near Riverbank Elementary School, extending the duration of travelers' views. Viewers who frequently travel these routes generally possess moderate visual sensitivity to their surroundings. The passing landscape becomes familiar to these viewers, and their attention typically is not focused on the passing views but on the roadway, roadway signs, and surrounding traffic. Viewers who travel local routes for their scenic quality generally possess a higher visual sensitivity to their surroundings because they are likely to respond to the natural environment with a high regard and as a holistic visual experience. Viewer sensitivity is high among most roadway travelers in this project area because it is within their neighborhood and community for which many viewers feel a strong ownership of.

Recreationists

Recreational users view the project area from parks, waterways, roadways, and from the levees themselves. Recreational uses consist of boating and fishing, nature watching, walking, running, jogging, and bicycling along levee crowns and local roads. Waterway users have differing views, based on their location in the landscape and are accustomed to variations in the level of industrial, commercial, suburban, and recreational activities occurring within the project area. The amount of vegetation present along the levees creates a softened, natural edge that is enjoyed by all recreationists. Local recreationists also have a high sense of ownership over the waterways, corridors, and levees they use for recreation, being that these areas are highly valued throughout the greater Sacramento area.

Viewer sensitivity is high among recreationists in the project area because they are more likely to value the natural environment highly, appreciate the visual experience, have a high sense of ownership, and be more sensitive to changes in views.

5.16.2 Environmental Consequences

This section describes the environmental consequences relating to visual effects for the proposed Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable

mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.14.3.3, Effects and Mitigation Measures.

5.16.2.1 Assessment Methods

The key effects were identified and evaluated based on the environmental characteristics of The Rivers EIP project area and the magnitude, intensity, and duration of activities related to the construction and operation of this project.

This evaluation of visual effects is based on:

- direct field observation from vantage points, including neighboring buildings, property, and roadways (conducted November 28, 2007, February 5, 2009, and Sept. 2009);
- photographic documentation of key views;
- professional standards (for discussion on these standards see Section 3.14.3.2.1);
- review of project construction drawings; and
- review of the project with regard to compliance with state and local ordinances and regulations and professional standards pertaining to visual quality.

5.16.2.2 Determination of Effects

For this analysis, an effect pertaining to visual resources was considered significant if it would result in any of the following environmental effects, which are based on professional practice and State CEQA Guidelines Appendix G (14 CCR 15000 *et seq*.):

- cause a substantial, demonstrable negative aesthetic effect on a scenic vista or view open to the public;
- substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
- substantially degrade the existing visual character or quality of the site and its surroundings; or
- create a new source of substantial light or glare that would adversely affect day or nighttime public views.

5.16.3 Effects and Mitigation Measures

5.16.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects relating to visual resources would occur. Therefore there would be no effect on this resource attributable to implementation of the No Action Alternative.

However, without levee improvements there is the continued risk of levee failure and levee deterioration would continue to occur, and the risk that the Sacramento River North Levee could fail

due to seepage or slope stability or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Visual Resources program analysis (Section 3.14.3.3.1). A catastrophic levee failure would result in flooding and inundation that could significantly damage existing visual resources. Flood-fight or cleanup activities could introduce new visual elements into the project area. In addition, the levee itself would be damaged irreparably or for an extended period of time which would remove a scenic vista the enjoyment derived by recreationists when viewing nature and wildlife scenery. Given the uncertainty of the occurrence or magnitude of such an event, potential effects on visual resources cannot be quantified based on available information.

It is assumed that under the No Action Alternative, compliance with USACE's guidance regarding vegetation on levees would occur. This could result in the removal of a substantial amount of vegetation at The Rivers EIP project area, causing a significant effect on visual resources similar to program Effect VIS-5: Affect the Existing Visual Character or Quality of the Site and Its Surroundings as a Result of Construction, Operations, and Maintenance

5.16.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on visual resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
VIS-2: Create a New Source of Light or Glare	Significant	Significant and unavoidable	No feasible mitigation
VIS-4: Cause Temporary Visual Effects as a Result of Construction Activities	Less than significant	N/A	N/A
VIS-5: Affect the Existing Visual Character or Quality of the Site and Its Surroundings as a Result of Construction, Operations, and Maintenance	Significant	Significant and unavoidable	No feasible mitigation
VIS-6: Conflict with Local Visual Resource Policies	Significant	Significant and unavoidable	No feasible mitigation

Effect VIS-2: Create a New Source of Light or Glare

The program would not add any new permanent source of light or glare. During The Rivers APA construction, it is expected that construction would occur at night, requiring temporary nighttime lighting. The staging area would also be lit at night for security reasons. Such nighttime lighting would be temporary through the duration of construction. There are many residences on the landside of the levee, within close proximity to The Rivers APA area, and there are 15 residences on top of the levee that may be directly within the construction zone. This effect would be significant because some residents would have direct views of the construction adjacent to their homes and to the nighttime lighting associated with the levee alternatives. This would significantly affect their viewshed as these residences are not accustomed to nighttime glare of this degree. This effect would be significant and unavoidable.

Because this effect is significant and unavoidable, those directly affected by this effect would be relocated. This effect is discussed in Section 5.14, "Socioeconomic and Community Effects". As part of the environmental commitment described in Section 2.9, Chapter 2, Alternatives, WSAFCA would

provide assistance for residents who are required to relocate during the construction period. WSAFCA would compensate residents for reasonable rent and living expenses incurred due to relocation. Residents would have the right to decent, safe and sanitary housing in accordance with the Uniform Act.

Effect VIS-4: Cause Temporary Visual Effects as a Result of Construction Activities

Construction activities associated with The Rivers APA would introduce considerable heavy equipment and associated vehicles into the views of adjacent residents, recreationists, motorists, and businesses. The equipment would be visible throughout the construction season. Presence of the equipment would temporarily degrade the visual quality of the project area to low vividness, intactness, and unity.

Residential viewer groups in the study area and vicinity are not accustomed to seeing construction activities and equipment, and sensitivity to such effects would be high. Other viewer groups are more accustomed to seeing construction activities and equipment from construction that has occurred in the business parks near the I Street Bridge, daily activities in the industrial areas, and local roadway construction projects and would have low sensitivity to construction effects.

However, because this effect is temporary, would last no longer than the construction duration, and is limited to the relatively small project area, it would not substantially degrade the visual quality of the study area. In addition, the implementation of an environmental commitment to provide temporary construction barriers, as needed, between construction zones and residences, as described in Section 2.9 of Chapter 2, Alternatives, would make this effect less than significant.

In addition, effects on roadway users would be less than significant because of the short intervals of time that they are in visual contact with the program reaches and familiarity with construction along other roadways in the vicinity.

Effect VIS-5: Affect the Existing Visual Character or Quality of the Site and Its Surroundings as a Result of Construction, Operations, and Maintenance

Construction of The Rivers APA has the potential to substantially degrade the existing visual character or quality of the project site and surroundings for viewer groups because construction would require the removal of all vegetation within the construction footprint and within established operations and maintenance vegetation-free zones according to USACE policies. This would mainly affect the levee crown, the landside and waterside levee slopes, and 15 feet from the toe on both sides.

Construction of The Rivers APA would require compliance with recent USACE policies regarding woody vegetation on levees. This policy requires that all woody vegetation within the levee prism must be removed and the levee slope maintained free of woody vegetation. The levee slopes and adjacent land for 15 feet on either side of the levee would be required to be maintained free of woody vegetation in perpetuity, resulting in the loss of a highly valued, regional aesthetic landscape component. Trees and vegetation located outside of the levee prism, construction footprint, and maintenance zone would remain to the extent possible and retain high visual quality (i.e. on the waterside berm between the levee maintenance zone and the Sacramento River where the mature oak forest and riparian forest would be allowed to remain. The mature vegetation along the berm on the waterside of the levee is characteristic of the region and is a striking, distinctive element in the

landscape. The existing vegetation that is removed will be replaced with herbaceous vegetation. An environmental commitment has been made by WSAFCA to minimize vegetation removal to the extent possible (Section 2.9, Chapter 2, Alternatives); however, maintaining the levee and levee maintenance zone void of the characteristic riparian vegetation and mature landscaping would highly degrade the visual character and quality of the area for all viewer groups. No feasible mitigation is available to reduce the effect. This effect would be significant and unavoidable.

Effect VIS-6: Conflict with Local Visual Resource Policies

As mentioned above under the local regulatory policies, the majority of the local jurisdictions have tree preservation ordinances and riverfront master plans where riparian vegetation and mature landscaping are highly desirable components that are greatly valued for the aesthetic qualities they provide. Construction of The Rivers APA would require the removal of all vegetation within the construction footprint and all woody vegetation within the levee prism, as well as within 15 feet from the levee toe on both sides. This removal of vegetation would conflict with local visual policies. Because vegetation in many areas would not be allowed to be replanted, as discussed in Effect VIS-5, no feasible mitigation is available to reduce the effect. This effect would be significant and unavoidable.

5.16.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on visual resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
VIS-2: Create a New Source of Light or Glare	Significant	Significant and unavoidable	No feasible mitigation
VIS-4: Cause Temporary Visual Effects as a Result of Construction Activities	Less than significant	N/A	N/A
VIS-5: Affect the Existing Visual Character or Quality of the Site and Its Surroundings as a Result of Construction, Operations, and Maintenance	Significant	Significant and unavoidable	No feasible mitigation
VIS-6: Conflict with Local Visual Resource Policies	Significant	Significant and unavoidable	No feasible mitigation

Effect VIS-2: Create a New Source of Light or Glare

This effect is the same as described above under The Rivers APA. The Rivers Alternative B would create a new source of light and glare that would result in a significant and unavoidable effect on local residents. Because this effect is significant and unavoidable, those directly affected by this effect would be relocated. This effect is discussed in Section 5.14, “Socioeconomic and Community Effects”. As part of the environmental commitment described in Section 2.9, Chapter 2, Alternatives, WSAFCA would provide assistance for residents who are required to relocate during the construction period.

Effect VIS-4: Cause Temporary Visual Effects as a Result of Construction Activities

This effect is the same as described above under The Rivers APA. The Rivers Alternative B would temporarily degrade the visual quality of the project area to low vividness, intactness, and unity. However, because this effect is temporary, would last no longer than the construction duration, and is limited a small area, it would not substantially degrade the overall visual quality in the study area. In addition, the implementation of an environmental commitment to provide temporary construction barriers, as needed, between construction zones and residences, as described in Section 2.9 of Chapter 2, Alternatives, would make this effect less than significant.

Effect VIS-5: Affect the Existing Visual Character or Quality of the Site and Its Surroundings as a Result of Construction, Operations, and Maintenance

This effect is the same as described above under The Rivers APA. The Rivers Alternative B would require compliance with recent USACE policies regarding woody vegetation on levees, and removal of all mature woody vegetation on the levee and within 15 feet of the toe on both sides of the levee would highly degrade the visual character and quality of the area for all viewer groups. Although an environmental commitment has been made by WSAFCA to minimize vegetation removal to the extent possible (Section 2.9, Chapter 2, Alternatives), this effect remains significant and unavoidable, and no feasible mitigation is available to reduce this effect.

Effect VIS-6: Conflict with Local Visual Resource Policies

This effect is the same as described above under The Rivers APA. The Rivers Alternative B would require the removal of all vegetation within the construction footprint and all woody vegetation within the levee prism, as well as within 15 feet from the levee toe on both sides. This removal of vegetation would conflict with local visual policies. Because vegetation in many areas would not be allowed to be replanted, as discussed in Effect VIS-5, no feasible mitigation is available to reduce the effect. This effect would be significant and unavoidable.

Section 5.17
Recreation—
The Rivers Early Implementation Project

5.17.1 Affected Environment

This section describes the affected environment for recreation in The Rivers EIP project area, including regulatory and environmental setting.

5.17.1.1 Regulatory Setting

5.17.1.1.1 Federal and State

No Federal or state plans, policies, regulations, or laws related to recreation resources apply to The Rivers EIP.

5.17.1.1.2 Local

The following local plans related to recreation may apply to implementation of The Rivers EIP. Please see Section 3.14.2.1, Regulatory Setting, for a more complete description of each plan.

- *City of West Sacramento General Plan*
- *City of West Sacramento Parks Master Plan*
- *Sacramento Riverfront Master Plan*
- *West Sacramento Bicycle and Pedestrian Path Master Plan*
- *Yolo County General Plan*

5.17.1.2 Environmental Setting

The Rivers EIP project area has a fairly wide vegetated berm with some informal social trails between the levee and the river, and this berm attracts some visitors for fishing, walking, running, and visiting the waterfront. Although access to this area is technically considered trespassing, the City's Police Department and Reclamation District 811 generally do not prosecute for informal recreational use (Shpak pers. comm. 2009). Bryte Park, a City of West Sacramento community park that is described in the Program Area Affected Environment, is located at the landside toe of the Sacramento River North Levee at the western end of The Rivers EIP project area.

5.17.2 Environmental Consequences

This section describes the analysis of effects relating to recreation resources for The Rivers EIP. It describes the methods used to determine the effects of the proposed project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and any applicable mitigation

measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.15.3.3, Effects and Mitigation Measures.

5.17.2.1 Assessment Methods

Effects on recreation related to implementation of The Rivers EIP were evaluated qualitatively. Generally, construction activities could result in a short-term loss of recreation opportunities by disrupting use of recreation areas or recreational boating corridors. A long-term effect could occur if a recreation opportunity is eliminated or the quality of that opportunity is severely reduced as a result of permanent project-related structures or operations. Long-term beneficial effects could occur if new or enhanced recreation opportunities are created through implementation of the project.

5.17.2.2 Determination of Effects

For this analysis, an effect pertaining to recreation was considered significant if it would result in any of the following environmental effects, which are based on professional practice and State CEQA Guidelines Appendix G (14 CCR 15000 *et seq*.):

- increase the use of existing neighborhood and regional parks or other recreation facilities such that substantial physical deterioration of the facility would occur or be accelerated;
- include recreation facilities or require the construction or expansion of recreation facilities that might have a significant physical effect on the environment;
- substantially restrict or reduce the availability or quality of existing recreation opportunities in the project vicinity; or
- implement operational or construction-related activities related to the placement of project facilities that would cause a substantial long-term disruption of any institutionally recognized recreation activities. Institutionally recognized recreation activities are those associated with an established publicly or privately operated recreation facility, or those actively administered or promoted by a public or private entity.

5.17.3 Effects and Mitigation Measures

5.17.3.1 No Action Alternative

The No Action Alternative would continue the existing deficiencies along the portion of the Sacramento River North Levee reach encompassed by The Rivers EIP project area (i.e., no levee improvements would be implemented). This means continued or even potentially increased risk that the Sacramento River North Levee could fail due to under-seepage, slope stability, or geometry issues, Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the recreation program analysis (Section 3.15.3.3.1). A catastrophic levee failure would result in flooding and inundation that could significantly damage existing facilities and infrastructure and erode soil, uproot plants, and otherwise damage substrate by hydraulic force. This would render recreation facilities, informal recreation areas, and trails unusable until cleanup and restoration activities could be undertaken. It is possible that after a catastrophic flood event, recreation facilities may never be fully restored to

their former condition, permanently reducing the quality and/or quantity of recreation opportunities in the area. In addition, scenic vistas for existing and future recreation facilities could be damaged irreparably or for an extended period of time which would reduce the enjoyment derived by recreationists. Given the uncertainty of the occurrence or magnitude of such an event, potential effects on recreation cannot be quantified based on available information.

It is assumed that under the No Action Alternative, compliance with USACE's guidance regarding vegetation on levees would occur. This could result in the removal of a substantial amount of vegetation at The Rivers EIP project area, causing a significant effect on recreation similar to program Effect REC-3: Long-Term Reduction in Quality of Existing Recreation Opportunities in the Levee Corridor.

5.17.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on recreation. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
REC-1: Temporary Disruption of Recreation Opportunities during Construction	Less than significant	N/A	N/A
REC-3: Long-Term Reduction in Quality of Existing Recreation Opportunities in the Levee Corridor	Significant	Significant and unavoidable	No feasible mitigation
REC-4: Permanent Loss of Recreation Facilities or Opportunities	Less than significant	N/A	N/A
REC-6: Long-Term Increase in Recreation Opportunities	Beneficial	N/A	N/A

Effect REC-1: Temporary Disruption of Recreation Opportunities during Construction

Bryte Park, a City of West Sacramento community park, is located at the landside toe of the Sacramento River North Levee, adjacent to the western end of The Rivers APA project site. In addition to this formal recreation facility, informal recreation activities occur along the levee in The Rivers APA project area, and on the adjacent waterside berm. These activities include fishing, walking, biking, running, and visiting the waterfront.

It is not anticipated that any portion of Bryte Park would need to be closed to accommodate construction activities. However, temporary disruption of the informal recreation activities would occur during construction when the levee crown and adjacent construction and staging areas are closed to public access. Additionally, proximity to construction equipment and activities may degrade recreational experiences on the waterside berm. However, this effect is temporary and there are alternative locations for these types of recreation activities in the city. With implementation of the environmental commitment requiring notification of construction area closure (described in Section 2.9, Chapter 2, Alternatives) to ensure public safety and provide closure notice in advance of construction activities, this temporary effect would be less than significant. No mitigation is required.

Effect REC-3: Long-Term Reduction in Quality of Existing Recreation Opportunities in the Levee Corridor

Implementation of The Rivers APA would follow USACE's policies regarding vegetation on levees. This would require removal of a substantial amount of mature trees and vegetation from the bank of the Sacramento River in The Rivers APA area, as the new policy forbids woody vegetation on the slopes and crown of the levee or within 15 feet of the waterside and landside levee toes. These zones would be maintained free of woody vegetation in perpetuity.

Many recreation activities rely on or are significantly enhanced by the presence of mature woody vegetation. Anglers rely on trees to provide shade during fishing activities, and wildlife viewers are attracted to areas with mature woody vegetation because of the wealth of wildlife such vegetation supports. Many other users, including pedestrians, bicyclists, equestrians and boaters also rely on this woody vegetation for shade, and for the visual character it contributes to the landscape (visual effects of permanent vegetation removal are discussed in Section5.16, "Visual Resources").

The majority of informal recreational uses on the levee and berm in and around The Rivers APA project area are tied to the mature riparian forest that characterizes the levee. These uses include fishing, wildlife viewing, walking, bicycling, and boating. Permanent loss of the woody vegetation on and within 15 feet of the Sacramento River North Levee would substantially reduce the quality of existing recreation activities in the area, and is therefore considered significant. No feasible mitigation is available to reduce this effect to a lesser level.

Effect REC-4: Permanent Loss of Recreation Facilities or Opportunities

As described in the Environmental Setting section above, Bryte Park, a West Sacramento community park, sits right at the landside toe of the existing levee toward the western end of The Rivers EIP project area. A running track and a soccer field are the closest park facilities to the levee. Neither construction activities nor expansion of the levee footprint are planned to intrude into the park, but if project activities were to damage or require removal of facilities at Bryte Park, it would be considered a significant effect, given the dearth of formal recreational facilities in the Bryte/Broderick neighborhoods. However, WSAFCA has committed to rebuilding all formal park facilities removed during construction activities (see the environmental commitment to rebuild affected formal park facilities described in Section 2.9, Chapter 2, Alternatives). With implementation of this environmental commitment, any affected park facilities would be rebuilt after construction of the project, and there would be no permanent loss of recreation opportunities. This effect would therefore be less than significant. No mitigation is required.

Effect REC-6: Long-Term Increase in Recreation Opportunities

As described in Chapter 2, Alternatives, The Rivers APA includes construction of new recreation facilities, including a paved bicycle/pedestrian levee crown trail, a meandering pedestrian trail parallel to the levee crown trail leading to a landing near the river, and interpretive signage. These new facilities would constitute an upgrade in quantity, quality, and safety to the existing facilities at The Rivers EIP project area, as well as an increase in recreation opportunities for the city. These recreation enhancements would also advance the policies of the planning documents listed below.

- *City of West Sacramento General Plan,*
- *City of West Sacramento Parks Master Plan,*

- *Sacramento Riverfront Master Plan,*
- *West Sacramento Bicycle and Pedestrian Path Master Plan, and*
- *Yolo County General Plan*.

This effect is considered beneficial.

5.17.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on recreation. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
REC-1: Temporary Disruption of Recreation Opportunities during Construction	Less than significant	N/A	N/A
REC-3: Long-Term Reduction in Quality of Existing Recreation Opportunities in the Levee Corridor	Significant	Significant and unavoidable—no feasible mitigation	N/A
REC-4: Permanent Loss of Recreation Facilities or Opportunities	Less than significant	N/A	N/A
REC-6: Long-Term Increase in Recreation Opportunities	Beneficial	N/A	N/A

Effect REC-1: Temporary Disruption of Recreation Opportunities during Construction

This effect is the same as described above under The Rivers APA. With implementation of the environmental commitment requiring notification of construction area closure to ensure public safety and provide closure notice in advance of construction activities (described in Section 2.9, Chapter 2, Alternatives), temporary disruption of recreation opportunities at The Rivers Alternative B site would be less than significant. No mitigation is required.

Effect REC-3: Long-Term Reduction in Quality of Existing Recreation Opportunities in the Levee Corridor

This effect is the same as described above under The Rivers APA. This effect is considered significant. No feasible mitigation is available to reduce this effect to a lesser level.

Effect REC-4: Permanent Loss of Recreation Facilities or Opportunities

As described in the Environmental Setting section above, Bryte Park, a West Sacramento community park, sits right at the landside toe of the existing levee toward the western end of The Rivers EIP project area. A running track and a soccer field are the closest park facilities to the levee. Neither construction activities nor expansion of the levee footprint are planned to intrude into the park, but if project activities were to damage or require removal of facilities at Bryte Park, it would be considered a significant effect, given the dearth of formal recreational facilities in the Bryte/Broderick neighborhoods. However, WSAFCA has committed to rebuilding all formal park

facilities removed during construction activities (see the environmental commitment to rebuild affected formal park facilities described in Section 2.9, Chapter 2, Alternatives). With implementation of this environmental commitment, any affected park facilities would be rebuilt after construction of the project, and there would be no permanent loss of recreation opportunities. This effect would therefore be less than significant. No mitigation is required.

Effect REC-6: Long-Term Increase in Recreation Opportunities

As described in Chapter 2, Alternatives, The Rivers Alternative B includes construction of new recreation facilities, including a paved bicycle/pedestrian levee crown trail, a meandering pedestrian trail parallel to the levee crown trail leading to a landing near the river, and interpretive signage. These new facilities would constitute an upgrade in quantity, quality, and safety to the existing facilities at The Rivers EIP project area, as well as an increase in recreation opportunities for the city. These recreation enhancements would also advance the policies of the planning documents listed below.

- *City of West Sacramento General Plan,*
- *City of West Sacramento Parks Master Plan,*
- *Sacramento Riverfront Master Plan,*
- *West Sacramento Bicycle and Pedestrian Path Master Plan, and*
- *Yolo County General Plan*.

This effect is considered beneficial.

Section 5.18
Utilities and Public Services—The Rivers Early Implementation Project

5.18.1 Affected Environment

This section describes the affected environment for utilities and public services in The Rivers EIP project area, including regulatory and environmental setting.

5.18.1.1 Regulatory Setting

5.18.1.1.1 State

The following state policies or agencies related to utilities and public services may apply to implementation of The Rivers EIP. Please see Section 3.16.2.1, Regulatory Setting, for a more complete description of each policy.

- California Public Utilities Commission
- California Integrated Waste Management Act

5.18.1.1.2 Local

The following local policies related to utilities and public services may apply to implementation of The Rivers EIP. Please see Section 3.16.2.1, Regulatory Setting, for a more complete description of each policy.

- *City of West Sacramento General Plan*

5.18.1.2 Environmental Setting

This section discusses the environmental setting related to utilities and public services in The Rivers EIP project area.

5.18.1.2.1 Utilities and Service Systems

Table 5.18-1 lists aboveground and underground utilities in The Rivers EIP project area.

Table 5.18-1. Utilities Located in The Rivers Project Area

Approximate Stations	Utility	Size	Owner
70+80	Access Manhole	N/A	Unknown
71+90	Access Manhole	N/A	Unknown
70+00–71+00	6-inch Water Main	6 inches	COWS
71+00	4-inch Water Main	4 inches	COWS
71+00–83+70	Telephone	N/A	AT&T
71+00–77+75	Electric	N/A	PG&E

Approximate Stations	Utility	Size	Owner
71+00–88+00	Electric	N/A	PG&E
92+50–118+00	2-inch Gas Line	2 inches	PG&E
92+50–118+00	Electric Line	N/A	PG&E
92+50–118+00	Telephone Line	N/A	AT&T
102+00–118+00	2-inch Gas Line	2 inches	PG&E
102+00–118+00	6-inch Sanity Sewer	6 inches	COWS
102+00–118+00	Electric Line	N/A	PG&E
102+00–118+00	Telephone Line	N/A	AT&T
102+50–105+00	8-inch Water Main	8 inches	COWS
106+00–115+00	Telephone Line	N/A	AT&T
107+00	15-inch Storm Drain	15 inches	WSRD
113+25	6-inch Sanitary Sewer	6 inches	COWS
115+50	15-inch Storm Drain w/Outfall	15 inches	WSRD

Source: HDR 2007 (Appendix D).

5.18.1.2.2 Public Services

Fire Protection

The City's Fire Department has the mission of protecting life, environment, and property within the city of West Sacramento. The fire station servicing The Rivers EIP project area is Station 44. It is open 24 hours a day, 7 days a week. Firefighters work 24-hour tours of duty.

Police Protection

The Police Department provides a full range of police services to the residents of West Sacramento 24 hours a day, 7 days a week.

The Police Department is staffed with 75 sworn officers and 39 civilian full-time employees. Other positions include part-time police officers, parking enforcement officers, reserve police officers, and volunteers.

The department is broken into three geographic "beats". Beat 1 patrols the northern portion of the City including the Bryte and Broderick areas, and is responsible for The Rivers EIP project area. Beat 2 encompasses the central City along West Capitol Avenue and Beat 3 is responsible for the area south of the DWSC (Arsenault pers. comm.)

Emergency Medical Services

No hospitals are located within the city of West Sacramento. The nearest hospital is Sutter General Hospital, which is 3.7 miles from West Sacramento at 29th Street in Sacramento.

5.18.2 Environmental Consequences

This section describes the environmental consequences relating to utilities and public services for The Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.16.3.3, Effects and Mitigation Measures.

5.18.2.1 Assessment Methods

This evaluation of utilities and public services is based on information obtained from:

- review of relevant documents and Web sites to obtain information regarding known public services and utilities in the study area,
- analysis of geographic map research to determine locations of existing utilities and public services for program components, and
- telephone calls and e-mail correspondence to area utility/service providers.

5.18.2.2 Determination of Effects

For this analysis, an effect pertaining to utilities and public services was analyzed under NEPA and CEQA if it would result in any of the following environmental effects, which are based on NEPA standards, State CEQA Guidelines Appendix G (14 CCR 15000 *et seq.*), and standards of professional practice:

- require the construction or expansion of electrical or natural gas transmission or distribution facilities;
- require the construction or expansion of a water conveyance or wastewater treatment facility or require new or expanded water supply entitlements;
- require the construction of new or expanded stormwater drainage facilities;
- require the construction or expansion of wastewater treatment facilities;
- cause the capacity of a solid waste landfill to be reached sooner than it would without the program;
- require the construction or expansion of communications facilities (telephone, cell, cable, satellite dish);
- significantly affect public utility facilities that are located underground or aboveground along the local roadways from program construction activities;
- create an increased need for new fire protection, police protection, or ambulance services or significantly affect existing emergency response times or facilities; or
- intersect with major infrastructure components, such as bridges or overpasses, requiring relocation of the components.

5.18.3 Effects and Mitigation Measures

5.18.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects relating to utilities or service systems would occur and none of these services would therefore be interrupted or damaged. Therefore, there would be no effect on this resource under the No Action Alternative.

However, because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to seepage or slope stability and geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Utilities and Public Services program analysis (Section 3.16.3.3.1).

In summary, those effects could include destruction, damage, or contamination of water delivery infrastructure, utility lines, water or wastewater piping .Varying levels of damage could be done to public service structures as well, causing delays in response from fire and police protection and delays in commuting to the nearest hospital to seek medical attention.

5.18.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on utilities and public service systems. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect PUB-1: Damage of Public Utility Infrastructure and Disruption of Service	Significant	Significant and unavoidable	PUB-MM-1: Verify Utility Locations, Coordinate with Utility Providers, Prepare a Response Plan, and Conduct Worker Training
Effect PUB-2: Exceed the Capacity or Shorten the Lifespan of Local Solid Waste Landfills as a Result of Construction	Less than significant	N/A	N/A

Effect PUB-1: Damage of Public Utility Infrastructure and Disruption of Service

Construction of The Rivers APA would result in the relocation of several underground utilities. Utilities within the levee prism include water, electricity, telephone, gas, and sanitary sewer lines; a storm drain; and two utility holes. According to Federal and CVFPB requirements, utilities are not allowed within the official level prism (defined by a 20-foot width along the crown and 3:1 slope ratio landside and waterside). The top portion of a levee that falls outside the official levee prism is called freeboard. Utilities are allowed to be placed within the freeboard portion of a levee. All of the existing utilities within The Rivers EIP project area may be relocated within the freeboard and would be temporarily out of service during relocation activities. Throughout the duration of construction, up to 147 days, utilities may be temporarily disrupted at 11 residential units.

During excavation activities, utilities would be intersected on each side of the levee, reconnected and temporarily rerouted to pass over the levee through the duration of construction. After cutoff wall construction, utility lines would be relocated within the freeboard of the levee. As noted in the environmental commitments, Section 2.9 of Chapter 2, Alternatives, WSAFCA would provide assistance for residents to relocate during construction activities and provide compensation to residents for reasonable rent and living expenses incurred due to relocation. In accordance with the Uniform Act, residents would be provided with decent, safe, and sanitary housing. Although disruption of utility services would be temporary and short in duration and the implementation of PUB-MM-1 would reduce the disruption of service, Effect PUB-1 would be significant and unavoidable.

Mitigation

Mitigation Measure PUB-MM-1: Verify Utility Locations, Coordinate with Utility Providers, Prepare a Response Plan, and Conduct Worker Training

WSAFCA will ensure the following measures are implemented to avoid and minimize potential damage to utility and service disruptions during construction. Implementing these measures will help ensure existing utilities are not damaged and that service interruptions are minimized.

- Obtain utility excavation or encroachment permits as necessary before initiating any work with the potential to affect utility lines, and include all necessary permit terms in construction contract specifications.
- Before starting construction, coordinate with utility providers in the area to locate existing lines. Avoid the relocation of utilities when possible. Provide notification of potential interruptions in services to the appropriate agencies.
- Before starting construction, verify utility locations through field surveys and Underground Service Alerts. Clearly mark any buried utility lines in the area of construction before any earthmoving activity.
- Before starting construction, prepare a response plan to address potential accidental damage to a utility line. The plan will identify chain-of-command rules for notifying authorities and appropriate actions and responsibilities to ensure the safety of the public and the workers. Contractors will conduct worker training to respond to these situations.
- Stage utility relocations to minimize service interruptions.

Effect PUB-2: Exceed the Capacity or Shorten the Lifespan of Local Solid Waste Landfills as a Result of Construction

Implementation of The Rivers APA may generate up to 69,000 cubic yards of levee material that would require disposal. A portion of the material could be disposed of on-site and used for new levee construction, as long as it is suitable material. Disposal of the soil material would occur if soil characteristics make it infeasible for reuse as levee material, or the soil is determined to have contaminants that would require appropriate disposal. Embankment fill material excavated to construct levee improvements would be evaluated for reuse after excavation and prior to disposal. Soil requiring disposal as part of The Rivers APA would likely be transported to the Yolo County Central Landfill; however, the location of the landfill used for disposal of spoil material and other construction-related waste may be determined by the construction contractor at the time of construction activity based on capacity, type of waste, and other factors. Only those landfills

determined to have the ability to accommodate the construction disposal needs of The Rivers APA would be used.

As of fall 2009, the remaining capacity for the Yolo County Central Landfill is 37,108,000 cubic yards. Some of the disposed soils may be deemed suitable by the Yolo County Central Landfill for other beneficial uses. These soils would only be temporarily stored at the landfill and would not have an effect on its overcall capacity. The current landfill closure projection is in 2070, which takes into account disposal growth rate, including both beneficial and non-beneficial soil materials. Assuming all of the estimated 69,000 cubic yards of soil would require permanent disposal, The Rivers APA implementation would represent less than 1% of the remaining capacity of the Yolo County Central Landfill. However, the option of beneficial re-use is likely to reduce the cubic yards of soil that require permanent disposal. These facts combined with the fact that the landfill has sufficient capacity remaining throughout the projected life of the WSLIP (15 to 20 years), would make this effect less than significant. No mitigation is required. (Borrego pers. comm.)

5.18.3.3 The Rivers Alternative B

Implementation of The Rivers APA would result in the following effects on utilities and public service systems. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect PUB-1: Damage of Public Utility Infrastructure and Disruption of Service	Significant	Significant and unavoidable	PUB-MM-1: Verify Utility Locations, Coordinate with Utility Providers, Prepare a Response Plan, and Conduct Worker Training
Effect PUB-2: Exceed the Capacity or Shorten the Lifespan of Local Solid Waste Landfills as a Result of Construction	Less than significant	N/A	N/A

Effect PUB-1: Damage of Public Utility Infrastructure and Disruption of Service

Construction of The Rivers Alternative B would result in the relocation of several underground utilities. Utilities within the levee prism include water, electricity, telephone, gas, and sanitary sewer lines; a storm drain; and two utility holes. According to Federal and CVFPB requirements, utilities are not allowed within the official level prism (defined by a 20-foot width along the crown and 3:1 slope ratio landside and waterside). The top portion of a levee that falls outside the official levee prism is called freeboard. Utilities are allowed to be placed within the freeboard portion of a levee. All of the existing utilities within The Rivers EIP project area may be relocated within the freeboard and would be temporarily out of service during relocation activities. Throughout the duration of construction, up to 57 days, utilities may be temporarily disrupted at 11 to 15 residential units.

During excavation activities, utilities would be intersected on each side of the levee, reconnected and temporarily rerouted to pass over the levee through the duration of construction. After cutoff wall construction, utility lines would be relocated within the freeboard of the levee. As noted in the environmental commitments, Section 2.9 of Chapter 2, Alternatives, WSAFCA would provide assistance for residents to relocate during construction activities and provide compensation to residents for reasonable rent and living expenses incurred due to relocation. In accordance with the

Uniform Act, residents would be provided with decent, safe, and sanitary housing. Although disruption of utility services would be temporary and short in duration and the implementation of PUB-MM-1 would reduce the disruption of service, Effect PUB-1 would be significant and unavoidable.

Mitigation

Mitigation Measure PUB-MM-1: Verify Utility Locations, Coordinate with Utility Providers, Prepare a Response Plan, and Conduct Worker Training

Effect PUB-2: Exceed the Capacity or Shorten the Lifespan of Local Solid Waste Landfills as a Result of Construction

Implementation of The Rivers Alternative B may generate up to 11,000 cubic yards of levee material that would require disposal. A portion of the material could be disposed of on-site and used for new levee construction, as long as it is suitable material. Disposal of the soil material would occur if soil characteristics make it infeasible for reuse as levee material, or the soil is determined to have contaminants that would require appropriate disposal. Embankment fill material excavated to construct levee improvements would be evaluated for reuse after excavation and prior to disposal. Soil requiring disposal as part of The Rivers Alternative B would likely be transported to the Yolo County Central Landfill; however, the location of the landfill used for disposal of spoil material and other construction-related waste may be determined by the construction contractor at the time of construction activity based on capacity, type of waste, and other factors. Only those landfills determined to have the ability to accommodate the construction disposal needs of The Rivers Alternative B would be used.

As of fall 2009, the remaining capacity for the Yolo County Central Landfill is 37,108,000 cubic yards. Some of the disposed soils may be deemed suitable by the Yolo County Central Landfill for other beneficial uses. These soils would only be temporarily stored at the landfill and would not have an effect on its overcall capacity. The current landfill closure projection is in 2070, which takes into account disposal growth rate, including both beneficial and non-beneficial soil materials. Assuming all of the estimated 11,000 cubic yards of soil would require permanent disposal, The Rivers Alternative B implementation would represent less than 1% of the remaining capacity of the Yolo County Central Landfill. However, the option of beneficial re-use is likely to reduce the cubic yards of soil that require permanent disposal. These facts combined with the fact that the landfill has sufficient capacity remaining throughout the projected life of the WSLIP (15 to 20 years), would make this effect less than significant. No mitigation is required. (Borrego pers. comm.)

Section 5.19
Public Health and Environmental Hazards—The Rivers Early Implementation Project

5.19.1 Affected Environment

This section describes the affected environment for public health and environmental hazards in The Rivers EIP project area, including the regulatory and environmental setting.

5.19.1.1 Regulatory Setting

5.19.1.1.1 Federal

The following Federal policies related to public health and environmental hazards may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.17.2.1, Regulatory Setting, for a more complete description of each policy discussion.

- Resource Conservation and Recovery Act
- Comprehensive Environmental Response, Compensation, and Liability Act

5.19.1.1.2 State

The following state policies related to public health and environmental hazards may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.17.2.1, Regulatory Setting, for a more complete description of each policy discussion.

- Hazardous Materials Release Response Plans and Inventory Act of 1985
- Hazardous Waste Control Act
- Emergency Services Act

5.19.1.1.3 Local

The following local policies related to public health and environmental hazards may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.17.2.1, Regulatory Setting, for a more complete description of each policy discussion.

- *Draft 2030 Countywide General Plan* for Yolo County, Health and Safety Element
- *City of West Sacramento General Plan*

5.19.1.2 Environmental Setting

This section discusses the environmental setting related to public health and environmental hazards in The Rivers EIP project area.

5.19.1.2.1 Hazardous Materials

Hazardous materials are chemicals and other substances defined as hazardous by Federal and state laws and regulations. In general, these materials are substances that, because of their quantity, concentration, or physical, chemical, or infectious characteristics, may have harmful effects on public health or the environment during their use or when released to the environment. Hazardous materials also include waste chemicals and spilled materials.

The EDR Report identified a hazardous site in the DWR Maintenance Yard located just west of the project area on Riverbank Road. Multiple leaking underground storage tanks, removed in 1994, are the source of contamination at this site. DWR has monitored the site for groundwater contamination since 2004 and has established the boundary of a groundwater petroleum plume originating from the tank location and spanning the eastern portion of the DWR maintenance facility, northwestern corner of Bryte Park, and a small western portion of The Rivers EIP project area. The groundwater petroleum plume would be affected by construction activities for The Rivers EIP. The effects from this construction are evaluated below under The Rivers EIP Environmental Consequences section and in Section 5.5, Water Quality and Groundwater Resources.

5.19.1.2.2 Wildland Fires

The area surrounding The Rivers EIP project area is not considered a fire-prone area.

5.19.1.2.3 Emergency Response and Evacuation

Emergency response and evacuation services for the project area are provided by the various departments in the city of West Sacramento and through Yolo County Sheriff, Fire, and Emergency Services Departments. The city of West Sacramento has entered into a joint flood operation agreement with the local reclamation districts. The agreement has established procedures to protect the health, safety, welfare and property of the residents and landowners in the program area. Procedures described in the document consist of flood preparedness, information management, monitoring, flood fighting, and flood evacuation.

5.19.1.2.4 Schools

Two schools are located within 0.25 mile of The Rivers EIP project area. These schools are Bryte Elementary School, located at 637 Todhunter Avenue and Riverbank Elementary School, located at 1100 Carrie Street.

5.19.2 Environmental Consequences

This section describes the environmental consequences relating to public health and environmental hazards for the proposed The Rivers EIP. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.17.3.3, Effects and Mitigation Measures.

5.19.2.1 Assessment Methods

The evaluation of potential effects on public health and environmental hazards addresses the potential for health and safety hazards during construction of The Rivers EIP alternatives. The analysis includes evaluation of (1) the potential effects related to construction activities on workers, and (2) general safety of and hazards to both workers and the public posed by the construction and implementation of the levee alternatives.

5.19.2.2 Determination of Effects

Criteria used for determining the significance of an effect on public health and environmental hazards are based on the environmental checklist included in Appendix G (14 CCR 15000 *et seq*.) of the State CEQA Guidelines as well as professional standards and practices. The proposed project was considered to cause a significant effect if it would:

- create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials to the environment;
- emit hazardous emissions or involve handling hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school;
- be located on a site that is on a list of hazardous materials sites compiled pursuant to California Government Code 65962.5, and as a result would create a significant hazard to the public or the environment;
- impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan;
- place within a 100-year flood hazard area structures that would impede or redirect flood flows;
- expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam; or
- significantly affect drinking water quality.

5.19.3 Effects and Mitigation Measures

5.19.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection. No construction-related effects relating to public health and environmental hazards would occur.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to seepage, slope stability, or geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city of the magnitude described in the Public Health and Hazards program analysis (Section 3.17.3.3.1). In summary, those effects could include creation of hazardous conditions for the public and environment through the spread of hazardous materials, structural damage to homes and other buildings, damage to electrical and gas delivery systems, and

contamination of the water supply. Receding floodwaters could also leave behind dangerous strains of mold and serve as breeding grounds for mosquitoes and other disease vectors. A major flood event could also disrupt or place severe strain on critical public services such as fire protection, police protection, and emergency medical assistance.

5.19.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on public health and environmental hazards. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect PH-1: Incidental Release of Hazardous Materials during Construction	Less than significant	N/A	N/A
Effect PH-2: Exposure to Hazardous Materials Encountered at Project Site	Significant	Less than significant	WQ-MM-1: Implement Measures to Maintain Surface Water quality and Groundwater Quality WQ-MM-2: Implement Provisions for Dewatering PH-MM-1: Complete Phase I and Phase II (if necessary) Environmental Site Assessment Investigations and Implement Required Measures
Effect PH-3: Safety Hazards from the Construction Site and Vehicles	Less than significant	N/A	N/A
Effect PH-4: Protection of People or Structures from Flood Hazards	Beneficial	N/A	N/A
Effect PH-5: Hazardous Materials Substances, or Waste Handled or Emitted within 0.25 Mile of an Existing or Proposed School	Significant	Less than significant	PH-MM-1: Complete Phase I and Phase II (if necessary) Environmental Site Assessment Investigations and Implement Required Measures PH-MM-2: Notify Washington Unified School District and Applicable Schools Located within 0.25 Mile of Project Construction Activities

Effect PH-1: Incidental Release of Hazardous Materials during Construction

The Rivers APA implementation would require the use of hazardous materials such as fuels and lubricants to operate construction equipment and vehicles such as excavators, compactors, haul trucks, and loaders. Bentonite (a non-hazardous material) would be transported to sites where slurry cutoff wall construction would occur. Construction contractors would be required to use, store, and transport hazardous materials in compliance with Federal, state, and local regulations during project construction. However, fuels, and lubricants could be accidentally released into the environment at the construction site and along haul routes, causing environmental or human exposure to these hazards. Risks to water quality (surface, ground, and drinking water) associated with incidental release of these materials are addressed in Section 5.5, Water Quality and Groundwater Resources.

As discussed in Section 5.5, the implementation of environmental commitments, including a SWPPP, a bentonite slurry spill contingency plan (BSSCP), an SPCCP, and the implementation of Mitigation Measures WQ-MM-1 and WQ-MM-2, would ensure that the risk of accidental spills and releases into

the environment would be minimal and that the effect on water quality would be less than significant.

In addition, WSAFCA would be required to comply with applicable Federal, state, and local laws, which would reduce the potential for accidental release of hazardous materials during their transport and use. Consequently, the risk of incidental release of hazardous materials during their transport and use in The Rivers APA construction activities is low and the effect is considered less than significant.

Effect PH-2: Exposure to Hazardous Materials Encountered at Project Site

There is the potential that known or previously undocumented hazardous materials could be encountered at The Rivers APA project site. Excavation and construction activities at or near areas of currently unrecorded soil or groundwater contamination could result in the exposure of construction workers, the general public, and the environment to hazardous materials such as petroleum hydrocarbons, pesticides, herbicides, fertilizers, contaminated debris, or elevated levels of other chemicals that could be hazardous. There is one known site located adjacent to and partially within The Rivers APA project site that contains hazardous materials: a petroleum groundwater plume at the DWR Maintenance Yard, described in the Environmental Setting. Construction activities in the vicinity of known or potentially unknown recognized environmental concerns could result in public health hazards.

Implementation of Mitigation Measures PH-MM-1, WQ-MM-1, and WQ-MM-2 described in Section 5.5, Water Quality and Groundwater Resources, and the implementation of environmental commitments of a SWPPP, a BSSCP, and SPCCP, as described in Section 2.9 of Chapter 2, Alternatives, would ensure that the effect on public health and the environment would be less than significant.

Mitigation

Mitigation Measure WQ-MM-1 Implement Measures to Maintain Surface Water Quality and Groundwater Quality

Mitigation Measure WQ-MM-2: Implement Provisions for Dewatering

Mitigation Measure PH-MM-1: Complete Phase I and Phase II (If Necessary) Environmental Site Assessment Investigations and Implement Required Measures

WSAFCA will conduct Phase I ESAs and, if necessary, Phase II ESAs or other appropriate testing. If necessary, the assessment will include an analysis of soil or groundwater samples for the potential contamination sites that have not yet been covered by previous investigations before construction activities begin.

Recommendations in Phase I and Phase II ESAs to address any contamination that is found will be implemented before initiating ground-disturbing activities. In addition, WSAFCA will implement the following measures before ground-disturbing or demolition activities begin, in order to reduce health hazards associated with potential exposure to hazardous substances:

- Prepare a site plan that identifies any necessary remediation activities appropriate for proposed land uses, including excavation and removal of contaminated soils, and redistribution of clean fill material on the project site. The plan will include measures that ensure the safe transport,

use, and disposal of contaminated soil and building debris removed from the site, as well as any other hazardous materials. In the event that contaminated groundwater is encountered during site excavation activities, the contractor will report the contamination to the appropriate regulatory agencies, dewater the excavated area, and treat the contaminated groundwater to remove contaminants before discharge into the sanitary sewer system. The contractor will be required to comply with the plan and applicable Federal, state, and local laws.

- Retain licensed contractors to remove all underground storage tanks.
- Notify the appropriate Federal, state, and local agencies if evidence of previously undiscovered soil or groundwater contamination is encountered during construction activities. Any contaminated areas will be cleaned up in accordance with the recommendations of Yolo County Environmental Health Division, Central Valley RWQCB, California Department of Toxic Substances Control, or other appropriate Federal, state or local regulatory agencies.,
- Prepare a worker health and safety plan before the start of construction activities that indentifies, at a minimum, all contaminants that could be encountered during construction activity; all appropriate worker, public health, and environmental protection equipment and procedures to be used during project activities; emergency response procedures; the most direct route to the nearest hospitals; and a Site Safety Officer. The plan will describe actions to be taken should hazardous materials be encountered on site, including protocols for handling hazardous materials and preventing their spread, and emergency procedures to be taken in the event of a spill.

Effect PH-3: Safety Hazards from the Construction Site and Vehicles

Under The Rivers APA, construction workers would operate vehicles and other mechanical equipment that, if used improperly, could result in safety hazards at the construction site. WSAFCA would ensure that all workers are properly trained to operate equipment. Safety precautions would be followed at all times during construction to avoid accidents. WSAFCA also would require that all workers have a valid driver's license and insurance. These measures would ensure that this effect would be less than significant.

In addition, people may walk, ride bicycles, or otherwise use the levee during the construction period. The staging of the equipment when construction is not underway (i.e., weekends, holidays, or overnight, if construction is not performed 24 hours per day) may pose a threat to public safety if the equipment is not properly secured. Proper signage and detours would be provided as stated in the environmental commitment to provide notification of construction area closure (described in Section 2.9, Chapter 2, Alternatives). These measures would reduce the risk to the public when construction is underway and when it is not. Therefore, this effect would be less than significant. No mitigation is required.

Effect PH-4: Protection of People or Structures from Flood Hazards

All levees have the potential to fail, regardless of design. USACE has set forth guidelines for levee design. Under The Rivers APA, the Sacramento River North Levee would be improved using methods that meet engineering requirements set forth by both USACE and the Reclamation Board. In addition, this levee would be improved to meet FEMA 200-year flood protection certification. This would be an improvement compared to the existing level of flood protection. Therefore, this effect would be beneficial.

Effect PH-5: Hazardous Materials, Substances, or Waste Handled or Emitted within 0.25 Mile of an Existing or Proposed School

There are two schools located within 0.25 mile of The Rivers APA project site. These schools are Bryte Elementary School located at 637 Todhunter Avenue and Riverbank Elementary School, located at 1100 Carrie Street. Construction of The Rivers APA would involve the use of potentially hazardous materials, such as fuels (gasoline and diesel) and oils, and may expose the contaminated groundwater plume located to the west of the project site. Undocumented contaminated soil or water may also be found during construction. The effect of exposure to incidental release of these hazardous materials by school-aged children would be significant.

WSAFCA would be required to comply with applicable Federal, state, and local laws related to transport and use of hazardous materials. Consequently, the risk of incidental release of hazardous materials near existing or proposed schools during their transport and use during program construction activities would be low. These measures, along with the implementation of Mitigation Measures PH-MM-1 and PH-MM-2 would ensure that this effect is less than significant.

Mitigation

Mitigation Measure PH-MM-1: Complete Phase I and Phase II (If Necessary) Environmental Site Assessment Investigations and Implement Required Measures

Mitigation Measure PH-MM-2: Notify Washington Unified School District and Applicable Schools Located within 0.25 Mile of Project Construction Activities

WSAFCA will provide written notification of projects to each of the affected schools and the Washington Unified School District within 30 days prior to certification of the EIS/EIR and will consult with Washington Unified School District regarding potential effects on school children from hazards associated with project construction.

5.19.3.3 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on public health and environmental hazards. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect PH-1: Incidental Release of Hazardous Materials during Construction	Less than significant	N/A	N/A
Effect PH-2: Exposure to Hazardous Materials Encountered at Project Site	Significant	Less than significant	WQ-MM-1: Implement Measures to Maintain Surface Water quality and Groundwater Quality WQ-MM-2: Implement Provisions for Dewatering PH-MM-1: Complete Phase I and Phase II (if necessary) Environmental Site Assessment Investigations and Implement Required Measures
Effect PH-3: Safety Hazards from the Construction Site and Vehicles	Less than significant	N/A	N/A
Effect PH-4: Protection of People or Structures from Flood Hazards	Beneficial	N/A	N/A

Effect	Finding	With Mitigation	Mitigation Measure
Effect PH-5: Hazardous Materials Substances, or Waste Handled or Emitted within 0.25 Mile of an Existing or Proposed School	Significant	Less than significant	PH-MM-1: Complete Phase I and Phase II (if necessary) Environmental Site Assessment Investigations and Implement Required Measures PH-MM-2: Notify Washington Unified School District and Applicable Schools Located within 0.25 Mile of Project Construction Activities

Effect PH-1: Incidental Release of Hazardous Materials during Construction

The Rivers Alternative B implementation would require the use of hazardous materials such as fuels and lubricants to operate construction equipment and vehicles such as excavators, compactors, haul trucks, and loaders. Construction contractors would be required to use, store, and transport hazardous materials in compliance with Federal, state, and local regulations during project construction. However, fuels, and lubricants could be accidentally released into the environment at the construction site and along haul routes, causing environmental or human exposure to these hazards. Risks to water quality (surface, ground, and drinking water) associated with incidental release of these materials are addressed in Section 5.5, Water Quality and Groundwater Resources.

As discussed in Section 5.5, the implementation of environmental commitments, including a SWPPP, an SPCCP, and the implementation of Mitigation Measures WQ-MM-1 and WQ-MM-2, would ensure that the risk of accidental spills and releases into the environment would be minimal and that the effect on water quality would be less than significant.

In addition, WSAFCA would be required to comply with applicable Federal, state, and local laws, which would reduce the potential for accidental release of hazardous materials during their transport and use. Consequently, the risk of incidental release of hazardous materials during their transport and use in The Rivers Alternative B construction activities is low and the effect is considered less than significant.

Effect PH-2: Exposure to Hazardous Materials Encountered at Project Site

This effect is the same as described above under The Rivers APA. There is the potential that known or previously undocumented hazardous materials could be encountered at The Rivers Alternative B project site that could result in the exposure of construction workers, the general public, and the environment to hazardous materials. Implementation of Mitigation Measures PH-MM-1, WQ-MM-1, and WQ-MM-2 described in Section 5.5, Water Quality and Groundwater Resources, and the implementation of environmental commitments of a SWPPP and SPCCP, as described in Section 2.9 of Chapter 2, Alternatives, would ensure that the effect on public health and the environment would be less than significant.

Mitigation

Mitigation Measure WQ-MM-1 Implement Measures to Maintain Surface Water Quality and Groundwater Quality

Mitigation Measure WQ-MM-2: Implement Provisions for Dewatering

Mitigation Measure PH-MM-1: Complete Phase I and Phase II (If Necessary) Environmental Site Assessment Investigations and Implement Required Measures

Effect PH-3: Safety Hazards from the Construction Site and Vehicles

This effect is the same as described above under The Rivers APA. Under implementation of The Rivers Alternative B, construction workers would operate vehicles and other mechanical equipment that, if used improperly, could result in safety hazards at the construction site. WSAFCA would ensure that safety precautions would be followed at all times during construction to avoid accidents. This effect would be less than significant. No mitigation is required.

Effect PH-4: Protection of People or Structures from Flood Hazards

This effect is the same as described above under The Rivers APA. Under The Rivers Alternative B, the Sacramento River North Levee would be improved using methods that meet engineering requirements set forth by both USACE and the Reclamation Board. In addition, this levee would be improved to meet FEMA 200-year flood protection certification. This would be an improvement compared to the existing level of flood protection. Therefore, this effect would be beneficial.

Effect PH-5: Hazardous Materials, Substances, or Waste Handled or Emitted within 0.25 Mile of an Existing or Proposed School

This effect is the same as described above under The Rivers APA. There are two schools located within 0.25 mile of The Rivers Alternative B project site, and potential exposure to incidental release of these hazardous materials by school-aged children would be significant. WSAFCA would be required to comply with applicable Federal, state, and local laws related to transport and use of hazardous materials. Consequently, the risk of incidental release of hazardous materials near existing or proposed schools during their transport and use during program construction activities would be low. These measures, along with the implementation of Mitigation Measures PH-MM-1 and PH-MM-2 would ensure that this effect is less than significant.

Mitigation

Mitigation Measure PH-MM-1: Complete Phase I and Phase II (If Necessary) Environmental Site Assessment Investigations and Implement Required Measures

Mitigation Measure PH-MM-2: Notify Washington Unified School District and Applicable Schools Located within 0.25 Mile of Project Construction Activities

Section 5.20
Cultural Resources—The Rivers Early Implementation Project

5.20.1 Affected Environment

This section describes the affected environment for cultural resources in The Rivers EIP project area, including the regulatory and environmental setting.

5.20.1.1 Regulatory Setting

5.20.1.1.1 Federal

The following Federal policies related to cultural resources may apply to the implementation of The Rivers EIP. Please see the program information in Section 3.18.2.1, Regulatory Setting, for a more complete description of each policy.

- Section 106 of the National Historic Preservation Act
- Federal Historic Significance Criteria

5.20.1.1.2 State

The following state policy related to cultural resources may apply to the implementation of The Rivers EIP. Please see Section 3.18.2.1, Regulatory Setting, for a more complete description of each policy.

- State Historic Significance Criteria (14 CCR 15064.5(a)(3)(A–D))

5.20.1.1.3 Local

The following local policies related to cultural resources may apply to the implementation of The Rivers EIP. Please see Section 3.18.2.1, Regulatory Setting, for a more complete description of each policy.

- *Yolo County General Plan*
- *City of West Sacramento General Plan*

5.20.1.2 Environmental Setting

This section discusses the environmental setting related to cultural resources in the project study area for The Rivers EIP including the records searches and field survey methods used to evaluate cultural resource conditions, and a summary of known cultural resources.

5.20.1.2.1 Records Search

In October 2007, Jones & Stokes requested a search of database files from both the Northwest Information Center and the North Central Information Center of the California Historical Resources

Information System located at California State University, Sacramento and Sonoma State respectively (see Methods in the Program section above).

The Rivers EIP project area has been previously surveyed (Holman 1984; Johnson and Johnson 1974; Peak & Associates 1985, 2005; Woodward and Evans 1992). The majority of survey coverage in The Rivers project area was completed more than 10 years ago, necessitating a new survey in support of the proposed project (see Field Survey below).

The records search indicates that the Sacramento River Levee is located in the project area. One previously recorded cultural resource, archaeological site CA-YOL-25, is located within 0.25 mile of the project area. The Sacramento Levee (CA-YOL-25) is a Native American occupation mound recorded by Heizer (1934). The site has not been relocated and is presumed destroyed as a result of the original levee construction.

5.20.1.2.2 Shipwrecks Database

ICF Jones & Stokes consulted the California State Lands Commission's Shipwrecks Database (2009) to determine whether historic shipwrecks may be present in The Rivers EIP project area. The database was searched by selecting Yolo County in the search field, which generated a list of 12 shipwrecks in Yolo County. The database search yielded latitude and longitude coordinates for 11 of the shipwrecks, which were plotted using an online mapping program (http://www.itouchmap.com/latlong.html) to determine whether any of the shipwrecks were in the project area.

5.20.1.2.3 Field Survey

In October 2007, an ICF Jones & Stokes archaeologist conducted a reconnaissance-level survey of the proposed project area. Although the records search indicated that the project area had been previously surveyed, an additional reconnaissance review of the project area was deemed necessary to confirm the previous findings and to confirm coverage of the entire project area. The project area is located within heavily a developed area of West Sacramento and very little, if any, natural ground surface remains. The project area has been graded, landscaped, and developed. No previously unidentified archaeological resources were noted within the project area.

On February 5 and March 10, 2008, an ICF Jones & Stokes architectural historian conducted a field survey of the project area. As part of the field process, buildings, structures, and linear features 45 years old[1] or older were inspected, photographed, and documented (see Summary of Known Cultural Resources below).

5.20.1.2.4 Native American Consultation

In January 2008, ICF Jones & Stokes cultural resources staff contacted the Native American Heritage Commission (NAHC) to request a search of their Sacred Lands File. The NAHC staff responded in January 2008 with a list of Native American contacts for both Yolo and Solano Counties and the results of the sacred lands data base research that was negative for findings in The Rivers EIP project area.

[1] Although the NRHP typically only considers properties that are 50 years or older for listing, the Office of Historic Preservation (1995: 2) employs a 45-year threshold for the recordation of cultural resources because "there is commonly a five year lag between resource identification and the date that planning decisions are made."

The NAHC contact list included the following federally recognized Native American tribes:

- Rumsey Indian Rancheria of Wintun Indians
- Cortina Band of Wintun Indians (including the Wintun Environmental Protection Agency)
- Ione Band of Miwok Indians

The NAHC also provided contact information for the following federally non-recognized Native American group and individual:

- Kesner Flores
- Wilton Miwok Rancheria

ICF Jones & Stokes staff sent letters to the Native American contacts on the lists provided by NAHC. The correspondence included a map depicting the program corridor, a brief description of the proposed program, and a request for the contacts to share any knowledge or concerns they may have regarding cultural resources in or adjacent to the study area. ICF Jones & Stokes received a letter response dated April 2008 from Mr. Marshall McKay, Tribal Chairman for the Rumsey Band of Wintun Indians. Mr. McKay's letter stated his gratitude for the letter notification about the proposed levee alternatives and that he was not aware of any sites of religious or cultural importance in the program corridor. Mr. McKay also stated that the Rumsey Indian Rancheria of Wintun would like to be notified of any cultural finds unearthed during construction actions. ICF Jones & Stokes staff placed follow-up telephone calls to the letter recipients on June 5, 2009. Voice messages were left with the contacts. To date, no return phone calls have been received.

5.20.1.2.5 Additional Research and Consultation

In an effort to identify important historic people, events, and trends that may have been associated with the project area, an ICF Jones & Stokes historian conducted archival research at the California State Library and the California State Archives, Sacramento. ICF Jones & Stokes also sent project notification letters to the Yolo County Historical Museum, the Yolo County Historical Society, the Sacramento Archives and Museum Collection Center, and the Portuguese Historical and Cultural Society requesting information regarding cultural resources that may be located within the project area. No responses have been received to date.

5.20.1.2.6 Summary of Known Cultural Resources

Based on the record search and a review of historic maps, two cultural resources 45 years old or older were identified in The Rivers EIP project area. These consist of the Sacramento Levee and the Riverbank Elementary School. The two resources were evaluated for the NRHP and CRHR as part of this project. The results of the survey and evaluation of the two architectural properties are documented in the technical report prepared for this project and are summarized below.

Sacramento River Levee

A segment of the Sacramento River Levee is located in The Rivers EIP project area. This segment is an earthen levee extending in a roughly east to west direction along the southern bank of the Sacramento River in the southern portion of the Rivers Site. The Sacramento River Levee is part of a conglomeration of water control structures constructed in the Sacramento Valley between the mid-19th and mid-20th century as a response to heavy flooding in the area, which occurred repeatedly

between the 1850s and early 1910s. Construction and improvements on the levee began as early as the 1860s and continued until the early to mid-20th century as increasing development in the area led to a greater need for more substantial and extensive levees. The Sacramento River Levee appears to meet NRHP Criterion A and CRHR Criterion 1 for its association with flood control and water reclamation efforts in California.

Riverbank Elementary School

Riverbank Elementary School is located in The Rivers EIP project area just south of Riverbank Road. The school a collection of stucco and concrete buildings constructed as early as 1962. It was originally known as Washington High School and by 2006, became Golden State Middle School. Presently the school operates as Riverbank Elementary School. The property lacks historic and architectural significance as well as integrity. For this reason it does not appear to meet the criteria for the NRHP or CRHR.

5.20.2 Environmental Consequences

This section describes the environmental consequences relating to cultural resources in The Rivers EIP project area. It describes the methods used to determine the effects of the project and lists the thresholds used to conclude whether an effect would be significant. The effects that would result from implementation of The Rivers EIP, findings with or without mitigation, and applicable mitigation measures are presented in a summary table. These effects tier from the program analysis effects, described in Section 3.16.3.3, Effects and Mitigation Measures.

5.20.2.1 Assessment Methods

Evaluation of effects on cultural resources is based on information provided by literature review, records searches, historic map research, and consultation with Native Americans. This information was then compared to the type and location of proposed flood control and recreation improvements to determine whether effects would occur.

5.20.2.2 Determination of Effects

5.20.2.2.1 Federal Criteria

According to 36 CFR 800.5, an undertaking would have an adverse effect on historic properties if the effect alters the characteristics[2] that make a property eligible for inclusion in the NRHP. Such effects also would be considered adverse under NEPA. Adverse effects can occur when prehistoric or historic archaeological sites, structures, or objects listed in or eligible for listing in the NRHP are subjected to the following phenomena:

[2] Cultural resource managers often refer to these characteristics as character-defining elements or features. Character-defining features are those characteristics of a historic property, historical resource, or unique archaeological resource that convey its significance; the loss of character-defining elements impedes a property's ability to convey its historical significance. The importance of character-defining elements in cultural resource assessments is made clear in *National Register* Bulletin 15, which mentions "character" in this context 42 times (Andrus and Shrimpton 1997).

- physical destruction of or damage to all or part of the property;
- alteration of the property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation, and provision of handicapped access, that is not consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties (36 CFR 68) and applicable guidelines;
- removal of the property from its historic location;
- change in the character of the property's use or of physical features within the property's setting that contribute to its historic significance;
- introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features;
- neglect of the property that causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to a Native American tribe or Native Hawaiian organization; or
- transfer, lease, or sale of the property out of Federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance.

5.20.2.2.2 State Criteria

CEQA defines a significant impact on cultural resources in 14 CCR 15064.5(b) (1) and (2) as one with the potential to cause a substantial adverse change in the significance of a historical resource or unique archaeological resource. Substantial adverse change in the significance of a resource means the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the resource would be materially impaired. The significance of a historical resource is materially impaired when a project results in demolition or material alteration in an adverse manner of those physical characteristics of a resource that:

- convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the CRHR;
- account for its inclusion in a local register of historical resources pursuant to PRC 5020.1(k) or its identification in a historical resources survey meeting the requirements of PRC 5024.1(g), unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
- convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by a lead agency for purposes of CEQA.

5.20.3 Effects and Mitigation Measures

5.20.3.1 No Action Alternative

The No Action Alternative represents the continuation of existing deficiencies along the portion of the Sacramento River North Levee reach in The Rivers EIP project area. No levee improvements would be made to increase the level of protection. Under the No Action Alternative, it is presumed that no ground-disturbing activities associated with levee repair and alternatives would occur.

Because no levee improvements would be made under the No Action Alternative, the risk that the Sacramento River North Levee could fail due to seepage or slope stability/geometry issues would continue. Failure of the Sacramento River North Levee, depending on the magnitude of the event, could cause catastrophic flooding of the entire city. If the Sacramento River North Levee were to fail, a cultural resource could be in the path of an inundation of debris and mud from that failure that could cause significant damage to or the complete destruction of the resource. Furthermore, emergency efforts to stop and repair a failed levee potentially would cause the same or more significant effects than those described for the proposed EIP. While the levee would be damaged, the potential extent of damage to the resource is unknown. It is also unknown whether these events would transpire and affect other cultural resources; therefore, further analysis of effects on cultural would be speculative. Federal agencies responsible for levee repairs would be responsible for compliance with Section 106, as would local governments responsible for carrying out Federal programs.

5.20.3.2 The Rivers Applicant Preferred Alternative

Implementation of The Rivers APA would result in the following effects on cultural resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect CR-1: Effects on Architectural (Built Environment) Resources and Cultural Landscapes	Less than Significant	N/A	N/A
Effect CR-2: Change in the Significance of an Archaeological Resource	Significant	Significant and unavoidable	CR- MM-1: Implement Inadvertent Discovery Procedures of the WSLIP Program Historic Properties Management Plan
Effect CR-3: Disturbance of Native American and Historic-Period Human Remains	Significant	Significant and Unavoidable	CR-MM-2: Implement Human Remains Discovery Procedures of the WSLIP Program Historic Properties Management Plan

Effect CR-1: Effects on Architectural (Built Environment) Resources and Cultural Landscapes

A portion of the Sacramento River Levee is located in The Rivers EIP project area and appears to meet NRHP and CRHR criteria. WSAFCA would not demolish or substantially alter the physical characteristics of the levee or cause a major change to its engineering design or overall setting. The Sacramento River Levee would continue to convey its historical significance. Consequently, there would be no adverse effect on this resource as a result of the proposed construction. No mitigation is necessary.

Effect CR-2: Change in the Significance of an Archaeological Resource

Although the project area has been surveyed and no archaeological resources were identified in the project area, there is the possibility that construction would unearth archaeological materials from beneath the ground surface. Damage to such resources, if they meet the significance criteria of the

NRHP and/or the CRHR, would constitute a significant effect under CEQA (14 CCR 15064.5) and an adverse effect under Section 106 of the NHPA and NEPA. Therefore, the effect on archaeological resources would be significant. While implementation of Mitigation Measure CR-MM-1 (Implement Inadvertent Discovery Procedures of the WSLIP Program Historic Properties Management Plan) would reduce the intensity of the effect, the effect would still be significant and unavoidable.

Mitigation

Mitigation Measure CR-MM-1. Implement Inadvertent Discovery Procedures of the WSLIP Program Historic Properties Management Plan

In the event that archaeological resources are identified because of project-related ground disturbance, the WSAFCA will implement the inadvertent discovery procedures of the WSLIP Program HPMP. The HPMP will direct the Corps and WSAFCA's cultural resources management activities in the WSLIP Program study area, including The Rivers EIP project area. The HPMP will describe the stop-work and consulting party communication protocols, a research design and methods for treatment of inadvertent archaeological discoveries, and reporting requirements. Implementation of the HPMP will ensure that any archaeological resources discovered during construction will be protected from additional damage or treated in such a manner that effects to the resources are compensated through scientific excavation, analysis, reporting, and, as may be appropriate, public interpretation of the resources.

Effect CR-3: Disturbance of Native American and Historic-Period Human Remains

The project area is located in an area that is considered of moderate to high sensitivity for archaeological cultural remains, including burials. The potential for buried human remains to be unearthed and disturbed during ground-disturbing activities that would be associated with levee repair and alternative construction within the study area is considered high. The disturbance of any human remains is considered a significant effect. Implementation of the human remains discovery provisions in the program HPMP (Mitigation Measure CR-MM-2) would likely reduce the severity of this effect, but it would still be considered a significant and unavoidable effect.

Mitigation

Mitigation Measure CR-MM-2. Implement Human Remains Discovery Procedures of the WSLIP Program Historic Properties Management Plan

In the event that human remains are identified because of project-related ground disturbance, the WSAFCA will implement the human remains discovery procedures of the WSLIP Program HPMP. The HPMP will direct the Corps and WSAFCA's cultural resources management activities in the WSLIP Program study area, including The Rivers EIP project area. The HPMP will describe the stop-work and consulting party communication protocols, procedures for consulting with descendant communities, a research design and methods for treatment of human remains discoveries, and reporting requirements. Implementation of the HPMP will ensure that any human remains discovered during construction will be protected from additional damage or treated in such a manner that effects to the resources are compensated through scientific excavation, analysis, reporting, and, as may be appropriate, public interpretation of the resources.

5.20.3.2.2 The Rivers Alternative B

Implementation of The Rivers Alternative B would result in the following effects on cultural resources. A description of these effects is provided below the summary table.

Effect	Finding	With Mitigation	Mitigation Measure
Effect CR-1: Effects on Architectural (Built Environment) Resources and Cultural Landscapes	Less than Significant	N/A	N/A
Effect CR-2: Change in the Significance of an Archaeological Resource	Significant	Significant and unavoidable	CR- MM-1: Implement Inadvertent Discovery Procedures of the WSLIP Program Historic Properties Management Plan
Effect CR-3: Disturbance of Native American and Historic-Period Human Remains	Significant	Significant and Unavoidable	CR-MM-2: Implement Human Remains Discovery Procedures of the WSLIP Program Historic Properties Management Plan

Effect CR-1: Effects on Architectural (Built Environment) Resources and Cultural Landscapes

This effect is the same as described above under The Rivers Applicant Preferred Alternative. The Rivers Alternative B would not cause an adverse effect on significant architectural resources as a result of the proposed construction. No mitigation is necessary.

Effect CR-2: Change in the Significance of an Archaeological Resource

This effect is the same as described above under The Rivers Applicant Preferred Alternative. There is the possibility that construction would unearth archaeological materials from beneath the ground surface. Implementation of Mitigation Measure CR-MM-1 would reduce the intensity of this effect, but the effect would still be significant and unavoidable.

Mitigation

Mitigation Measure CR-MM-1. Implement Inadvertent Discovery Procedures of the WSLIP Program Historic Properties Management Plan

Effect CR-3: Disturbance of Native American and Historic-Period Human Remains

This effect is the same as described above under The Rivers Applicant Preferred Alternative. The disturbance of any human remains would be considered a significant effect. Implementation of Mitigation Measure CR-MM-2 would likely reduce the severity of this effect, but it would still be considered a significant and unavoidable effect.

Mitigation

Mitigation Measure CR-MM-2. Implement Human Remains Discovery Procedures of the WSLIP Program Historic Properties Management Plan

Chapter 6
Growth-Inducing and Cumulative Effects

6.1 Growth-Inducing Effects

6.1.1 Introduction

NEPA and CEQA require that an EIS and EIR discuss how a project, if implemented, could induce growth. This chapter presents an analysis of the potential growth-inducing effects of the WSLIP. This chapter includes:

- background information related to growth inducement,
- the methods used to analyze growth-inducing effects, and
- the effect conclusions.

6.1.2 Affected Environment

6.1.2.1 Regulatory Setting

6.1.2.1.1 NEPA and CEQA Requirements

Under authority of NEPA, CEQ regulations require EISs to consider the potential indirect effects of a proposed action. The indirect effects of an action include those that occur later in time or farther away in distance, but are still reasonably foreseeable, and "may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate" (40 CFR Section 1508.8[b]).

In addition, Section 21100(b)(5) of CEQA requires an EIR to discuss how a proposed project, if implemented, may induce growth and the impacts of that induced growth (see also State CEQA Guidelines Section 15126). CEQA requires an EIR to discuss specifically "the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment" (State CEQA Guidelines Section 15126.2[d]).

6.1.2.1.2 Regulations Regarding Floodplain Development

Executive Order 11988 (May 24, 1977) requires a Federal agency, when taking an action, to avoid short- and long-term adverse effects associated with the occupancy and the modification of a floodplain, and it must avoid direct and indirect support of floodplain development whenever there is a reasonable and feasible alternative. If the only reasonable and feasible alternative involves siting in a floodplain, the agency must minimize potential harm to or in the floodplain and explain why the action is proposed in the floodplain.

In February 1978, the Water Resources Council issued Floodplain Management Guidelines for Implementing Executive Order 11988. These guidelines provide analysis of the Executive Order, definitions of key terms, and an eight-step decision-making process for carrying out the Executive

Order's directives. The process contained in the Water Resources Council guidelines incorporates the basic requirements of the Executive Order. Briefly, the eight-step process is outlined below, followed by discussion of the WSLIP's application of the process to demonstrate compliance.

- **Step 1: Determine if a proposed action is in the base floodplain (100-year floodplain or 1% chance flood or 500-year or 0.2% if the action falls under the definition of critical, discussed separately below).** The WSLIP and proposed EIPs are activities located primarily on the high ground and levees around West Sacramento and as such are not directly within the base 100-year floodplain but would improve the current level of protection ultimately to the goal of 200-year protection. The proposed improvements are described in Chapter 2 at the program level and Chapters 4 and 5 at the project level (for CHP Academy and The Rivers, respectively), including location, construction methods, and operations and maintenance activities.

  The Water Resources Council Floodplain Management Guidelines presented the concept of a critical action. While there is no precise definition of critical action, the guidelines (under Part II, Decision-Making Process, Step 1C) outline the parameters of critical actions. To summarize, as noted in the guidelines, a critical action is "any activity for which even a slight chance of flooding is too great." This definition is intended to apply to Federal actions where that action would involve facilities or infrastructure that are sensitive to flooding, where the consequences of flooding would be severe in terms of ability to provide essential community services or to protect life and welfare (as described in the criteria above). Under the WSLIP, it is the levee improvement program itself that will reduce the chance of flooding, rather than being sensitive to or compromised by flooding; i.e., its purpose is to manage flood risk. Therefore, the WSLIP and its EIPs are not considered a critical action because they are intended to withstand flood conditions, reduce flood risk, and increase flood protection.

- **Step 2: Provide public review.** The NEPA/CEQA process provides for public disclosure; this EIS/EIR is one instrument for public review of the WSLIP and proposed EIPs. As discussed in Chapter 1, USACE and WSAFCA have established a proactive multi-media outreach program to communicate the WSLIP and allow for public review and disclosure. The approach to the outreach program has been to go beyond the guidelines and requirements of NEPA and CEQA for public noticing to ensure the affected community and other interested stakeholders are informed, engaged, and involved through an accessible, open, and transparent process. Thus far, the outreach program has included the following actions:
  - four scoping meetings for the environmental document (two for the joint NEPA/CEQA document and two prior for CEQA only);
  - publication of notices in local newspapers of major circulation;
  - publication in the *Federal Register*;
  - notification to the State Clearinghouse;
  - posting NEPA notices on the USACE website;
  - posting CEQA notices and project information on the City/WSAFCA website;
  - publication of feature articles in the City Lights newsletter, distributed quarterly to all city residents for updates and information about City business;

- presentation and discussion of the status of the WSLIP at various public meetings for elected boards and commissions;
- direct mailing to residents within proximity of proposed construction activities;
- phone calls to public agencies;
- small-group meetings with interested stakeholders; and
- posting of notices in public places.

As the proposed improvements and EIS/EIR are further developed, the outreach program will continue in a broad sense via the methods listed above and will expand through more targeted specific outreach to residents and businesses who might be more directly affected by construction or operation of the proposed improvements.

To date, the results of the outreach program have been very favorable, constructive, and supportive for the WSLIP. The tone and substance of the input has been consistent with the very favorable response for the voter-approved assessment to fund the local share of the WSLIP. Comments received from the public have been considered to refine the project description and the environmental analysis.

A more detailed accounting of the scoping process is provided in Appendix A.

- **Step 3: Identify and evaluate reasonable and feasible alternatives to locating in the base floodplain.** Firstly, it should be noted that previously West Sacramento has not been mapped in the base floodplain, and land use planning decisions have been based on studies demonstrating protection from the base flood. Only recent studies (as described in Chapter 1) based on evolving levee standards now necessitate improvements to continue maintaining protection above the base floodplain. The proposed action (the WSLIP) is specifically targeted to provide such improvements and exceed the level of protection beyond the base flood to that of the 0.5% chance (200-year) flood event or better.

  General engineering and environmental analyses have been performed for the program- and project-level alternatives for the WSLIP, following an identification and screening process discussed in Chapter 2, Alternatives. Detailed analyses were performed for the project-level alternatives and have found the proposed action to be the only practicable alternative that achieves the objectives of the project. Construction of the WSLIP will remove thousands of transportation, commercial, institutional, and residential structures and nearly 50,000 residents out of the base floodplain.

- **Step 4: Identify the impacts of the proposed action.** This EIS/EIR analyzes the environmental effects potentially resulting from the WSLIP and proposed EIPs per NEPA/CEQA requirements. Review under the Endangered Species Act, Clean Water Act, Clean Air Act, and other Federal and state environmental regulations is also occurring in coordination with the EIS/EIR. Program-level impacts are disclosed and analyzed in Chapter 3 and project-level impacts for the EIPs are in Chapters 4 and 5 (for CHP Academy and The Rivers, respectively). In brief, the CHP Academy EIP may have temporary construction-related effects on roadways, air quality from heavy equipment use, and biological resources (due to temporary disruption of or construction near habitat). The Rivers EIP may have temporary construction-related effects on roadways; temporary effects on biological resources (due to temporary disruption of or construction near habitat); and temporary construction-related effects on residents due to noise generation, changes in visual quality, and interruption in utility service and property access.

- **Step 5: Minimize threats to life and property and to natural and beneficial floodplain values. Restore and preserve natural and beneficial floodplain values.** The WSLIP and proposed EIPs would reduce flood risk for West Sacramento and increase protection for life and property within the city. The existing levee system was originally designed and constructed to provide a minimum level of protection from the base flood and ensure that human life and structures are out of the floodplain. The WSLIP target is to maintain and increase the level of protection beyond that of the base flood to a minimum 200-year protection (0.5% chance). The existing floodplain on the waterside of the levee would be largely unchanged; however, setback levees are evaluated as part of the program and may be proposed as appropriate measures for some segments, thereby allowing for preservation and enhancement of riparian habitat and other natural and beneficial floodplain values.
- **Step 6: Reevaluate alternatives.** This EIS/EIR is part of a step-wise evaluation process to refine the alternatives through public review as well as through resource and regulatory agency input in consultation for compliance with the Clean Water Act, Endangered Species Act, and other project authorizations. The alternatives have been evaluated at the planning level for initial screening (in Chapter 2), through programmatic analysis for secondary screening (Chapter 3), and re-evaluation through project-level analysis (Chapters 4 and 5). The alternatives are also continuously evaluated on a technical basis through independent review of the design documents (i.e., plans and specifications) at several levels of design development, including expert peer review by a Board of Senior Consultants. The recommendations and design refinements resulting from these reviews have been incorporated in the program description and environmental commitments (Chapter 2), resource analyses and findings (Chapters 3, 4, and 5), and project-level analyses and mitigation measures (Chapters 4 and 5). This level of screening analysis has demonstrated that the proposed actions at the CHP Academy and The Rivers sites are the most practicable alternatives.
- **Step 7: Issue findings and a public explanation.** To conclude the NEPA process, a record of decision for the project-level action (EIPs) will be publically issued following the Final EIS. To conclude the CEQA process, findings will be publically issued following the Final EIR. A public workshop will be conducted during the draft document stage and a public hearing will be held to decide on project adoption by WSAFCA as an action under CEQA.
- **Step 8: Implement the action.** WSAFCA intends to construct the EIPs as soon as possible based on conclusion of the project approval processes, targeted to be initiated in the 2011 construction season.

In conclusion, the WSLIP and proposed EIPs would reduce the risk of flood loss and minimize the impact of floods on human health, safety, and welfare by improving existing flood management infrastructure, and would increase protection for existing urban development and remove a potential obstacle to future growth. Because there is no reasonable and feasible alternative to the urban development indirectly associated with the WSLIP and proposed EIPs and because the actions will improve flood protection, it is not in conflict with Executive Order 11988. This EIS/EIR further complies with this Executive Order by identifying the most reasonable and feasible flood improvement alternative and disclosing the potential effects of actions under the WSLIP that may lead to growth or other direct and indirect effects. Additionally, Chapter 1, Introduction, and Chapter 2, Alternatives, explain why levee improvements are necessary for West Sacramento, regardless of how they may affect future development and growth.

6.1.2.2 Environmental Setting

The information in this section provides context for the analysis and helps the reader understand the structure of the analysis. This background information includes the legal requirements for analyzing growth-inducing effects in CEQA and NEPA documents.

6.1.2.2.1 Growth Projections

California's population is estimated at 36 million people in 2005 and is expected to rise to nearly 44 million by 2025 (U.S. Bureau of the Census 2008).

Locally, the population of West Sacramento has grown from 31,615 people in 2000 to an estimated 47,782 as of January 1, 2009 (California Department of Finance 2009). According to the Sacramento Area Council of Government's population growth and distribution data, 87,402 people are projected to reside in the city of West Sacramento in 2035 (Sacramento Area Council of Government 2008). Anticipated growth projections described in the General Plan Update are discussed below.

6.1.2.2.2 Current and Planned West Sacramento Development

West Sacramento has experienced extensive growth over the last decade. This growth has been generally consistent with the *City of West Sacramento General Plan* but has slowed considerably as a result of current economic conditions and the pending floodplain mapping (Rikala pers. comm.). The General Plan Update is in the development stages and set to be released in 2010. The General Plan Update will describe the development anticipated to occur by the year 2030 and disclose the fact that growth and development in the city are expected to be strongly tied to flood control improvements because of restrictions by FEMA resulting from existing levee conditions.

The General Plan Update is expected to characterize new development and recently completed development. The City released an alternatives report in October 2009 describing three alternative land use scenarios showing different levels of development over the next 20 years. Public meetings will be scheduled to provide for public comment on the alternatives and the City will eventually approve a preferred alternative to further evaluate for the General Plan Update.

Table 6-1 presents preliminary data describing the three alternatives that are in consideration. The base case describes present conditions and likely future developments in the absence of any changes to existing general plan. The future growth was planned with the assumption that the area will have adequate flood protection. The base case data have been analyzed in the following documents.

- *City of West Sacramento General Plan EIR* (1990)
- *City of West Sacramento General Plan 2000 Update SEIR* (2000)
- *Triangle Specific Plan EIR* (1993)
- *Washington Specific Plan EIR* (1995)
- *Southport Framework Plan EIR* (1994)
- *Triangle Specific Plan SEIR*; anticipated certification October 2009 (2009)

To account for growth relative to flood risk management, the City has in place the following measures (introduced in Chapter 1).

- An Emergency Operations Plan, which includes a Flood Plan and an Evacuation Plan, is reviewed yearly with a more comprehensive update minimally every three years to accommodate changes in population and the built environment.
- The City's municipal code (Chapter 15.50) requires new developments to provide 200-year protection or pay into an in-lieu fee program to fund WSAFCA's flood protection efforts.

6.1.2.2.3 Emergency Response and Evacuation

The City of West Sacramento, RD 537, and RD 900 have entered a joint flood operation agreement. The agreement has established procedures to protect the health, safety, welfare and property of the residents and landowners in the program area. Procedures described in the document consist of flood preparedness, information management, monitoring, flood fighting, and flood evacuation. As discussed above, emergency response is addressed through a Flood Plan and Evacuation Plan as components of the City's Emergency Operations Plan (EOP). City residents and other interested parties are informed of updates to the EOP through the City's website and *City Lights*, a publication specifically for the City of West Sacramento and distributed to all residents. In addition, the Fire Department regularly conducts community outreach and informs residents on the latest information related to emergency preparedness.

Emergency response and evacuation services for the program area are provided by the various departments in the City of West Sacramento and cities nearest to the program area and through Yolo County and Solano County Sheriff, Fire, and Emergency Services Departments. The City established an Emergency Operations Center, a special City facility opened in times of major emergencies. The purpose of the center, also connected to a regional resource system, is to act as the central point of communications directing personnel and resources. The Emergency Operations Center will be managed and operated by City staff members who are trained to fulfill emergency functions. The City has also established a City Slow Rise Flood Plan published on the City's website describing a series of seven stages in which specific actions are taken as water rises in the Sacramento River and Yolo Bypass. Residents are informed of emergencies through several media, including TV, radio, print, the Reverse 911 System, website, fire and law enforcement loudspeakers on vehicles, door–to-door and, as needed, loudspeakers on helicopters. The City is prepared to evacuate citizens with special care needs and those housed within special care facilities during the general public voluntary evacuation stage.

6.1.2.2.4 Previous Flood Improvement Efforts

As described in previous sections, the city lies within the natural floodplain of the Sacramento River, which bounds the city along the east. It is made up of reclaimed land protected from floods by levees and the Yolo and Sacramento Bypass systems. West Sacramento has many residents and the supporting infrastructure and property; however, the people and property require a level of protection greater than that provided currently. Over the past several decades, as portions of the West Sacramento area were converted from agricultural lands and open space to developed areas, many agencies have implemented projects to improve flood control for West Sacramento.

USACE, CVFPB, WSAFCA, and West Sacramento have a long history of working to improve flood protection in the West Sacramento region. Levees have been improved to current standards and development has proceeded with the understanding that levees provide adequate protection for the existing land uses.

The comprehensive levee evaluation has shown that the levees protecting the city need improvements to meet FEMA's minimum acceptable level of flood protection.

Table 6-1. West Sacramento General Plan Update Alternatives

Alternative	Net New Dwelling Units	Net New Population	Net New Employment
Base Case	21,129	48,761	41,369
Alternative A	29,832	65,883	56,042
Alternative B	22,550	50,893	32,175
Alternative C	30,554	72,959	51,125

6.1.3 Environmental Consequences

An action that removes an obstacle to growth is considered to be growth inducing. As such, where flood risk may be seen as an obstacle to growth in an area, levee improvements that would reduce that risk may be considered to remove an obstacle to growth and thereby be indirectly growth-inducing.

Growth inducement itself is not an environmental effect, but it may lead to environmental effects. These environmental effects may include increased demand for utilities and public services, increased traffic and noise, degradation of air or water quality, degradation or loss of plant or animal habitats, and conversion of agricultural and open space land to urban uses. Growth within a floodplain area increases the risk to people or property from flooding.

However, if the induced growth is consistent with or provided for by the adopted land use plans and growth management plans and policies for the area affected (e.g., city and county general plans, specific plans, transportation management plans), those plans may ensure that these effects are either less than significant or mitigated to a less-than-significant level. In some instances, significant and unavoidable impacts would occur as a result of implementation of land use plans. All effects associated with this planned growth are the responsibility of the city or county in which the growth takes place, developers, or other entities proposing or approving the development. Local land use plans provide for land use development patterns and growth policies that encourage orderly urban development supported by adequate urban public services such as water supply, roadway infrastructure, sewer services, and solid waste services.

6.1.3.1 Assessment Methods

Implementing the WSLIP and increasing flood protection in West Sacramento could result in indirect growth-inducing effects by removing an obstacle to growth. All of the treatments would result in the same outcome related to growth: improved flood protection allowing for certification of the levees and an increased rate of development. As such, growth effects under the No Action Alternative and under the WSLIP as an overall program are described, without differentiation among the various alternatives or reaches evaluated in this EIS/EIR.

6.1.3.2 Effects and Mitigation Measures

6.1.3.2.1 No Action Alternative

Under the No Action Alternative, WSAFCA would not implement flood control alternatives. The levees protecting the city would continue to deteriorate and necessitate improvements to meet FEMA's and the state's minimum acceptable levels of flood protection. In addition, the associated risk to human health and safety, property, and the adverse economic impact that serious flooding could cause would continue, and the risk of a catastrophic flood would remain high. Again, however, regular operations and maintenance of the levee system would continue as prescribed and as presently executed by the local maintaining entities, but not improvements would be implemented. Further detail on the No Action Alternative is provided in Section 2.4 of Chapter 2, Alternatives.

As described in Chapter 2, Alternatives, despite the likelihood of state- or Federal-led implementation of repairs, for the purposes of evaluating impacts under the No Action Alternative, the EIS/EIR assumes that the improvements would not occur. This assumption provides the most conservative approach for disclosure and comparison of potential effects. Therefore, the No Action Alternative assumes no levee repair or strengthening would be implemented, the purpose and objectives would not be met, and flood risk would continue.

6.1.3.2.2 Proposed Program

Removing Obstacles to Growth—Flood Protection

The proposed program is necessary to protect people and property, but it would also remove an obstacle to growth currently planned for undeveloped lands in West Sacramento. The current level of flood protection results in increased costs to develop and insure properties. As such, it provides a disincentive to develop in West Sacramento. Improving flood control, and the subsequent improvement in FEMA rating, would remove an obstacle to growth because it could make development easier or more attractive. As such, the indirect growth-inducing effects of the WSLIP are the direct effects of implementing the planned development in West Sacramento. The City is developing a General Plan Update, for which effects have not yet been identified or evaluated. However, it is expected that the General Plan Update will include considerable development of undeveloped lands and that this would result in environmental effects.

Environmental effects associated with this growth include the conversion of agricultural and other open land to urban uses that may significantly affect agricultural and biological resources (including special-status species and other sensitive resources) at those locations subject to such conversion. In addition, this conversion could lead to changes in stormwater runoff quantity and quality, and effects on cultural resources. Increases in population could lead to effects on air and water quality, traffic and noise conditions, and increases in the demand for such public services as schools, fire, police, sewer, solid waste disposal, and electrical and gas utilities. In addition, the expansion of such services could result in additional significant effects. The effects of this growth will be analyzed in the *West Sacramento 2030 General Plan Update SEIR*. Mitigation measures could include locating the growth in areas where sensitive resources are absent, minimizing the loss of these resources, or replacing any loss. The City of West Sacramento could impose feasible mitigation measures on development that would reduce or eliminate these effects. Ultimately, the effects associated with growth in West Sacramento are the responsibility of West Sacramento and specific project proponents.

Although the WSLIP may be considered growth-inducing because it would remove an obstacle to growth, the proposed levee alternatives are the most reasonable and feasible alternatives (see Section 2.2.2, Alternative Screening Process) and are necessary to protect the existing population and property. As such, the growth-inducing effect of the WSLIP would be an unavoidable secondary effect of necessary flood improvements for West Sacramento.

6.2 Cumulative Effects

6.2.1 Introduction

The cumulative effects analysis determines the combined effect of the WSLIP and other closely related, reasonably foreseeable, projects. This chapter introduces the methods used to evaluate cumulative effects, lists related projects, and describes their relationship to the WSLIP, identifies cumulative effects by resource area, and recommends mitigation for significant cumulative effects.

6.2.2 Approach to Cumulative Effect Analysis

6.2.2.1 Legal Requirements

NEPA regulations and State CEQA Guidelines require that the cumulative effects of a proposed project be addressed under NEPA when the cumulative effects are expected to be significant, and under CEQA when the project's incremental effect is cumulatively considerable (Guidelines 15130[a], 40 CFR 1508.25[a][2]). Cumulative effects are effects on the environment that result from the incremental effects of a proposed action when added to other past, present, and reasonably foreseeable future actions (Guidelines 15355[b], 40 CFR 1508.7). Such effects can result from individually minor but collectively significant actions taking place over time.

Section 15130 of the State CEQA Guidelines states that the discussion of cumulative impacts need not provide as much detail as the discussion of impacts attributable to the project alone. The level of detail should be guided by what is practical and reasonable.

6.2.2.2 Methods

According to the State CEQA Guidelines (Section 15130), an adequate discussion of significant cumulative impacts should contain the following elements:

- an analysis of related future projects or planned development that would affect resources in the project area similar to those affected by the proposed project,
- a summary of the expected environmental effects to be produced by those projects with specific reference to additional information stating where that information is available, and
- a reasonable analysis of the cumulative impacts of the relevant projects. An EIR must examine reasonable, feasible options for mitigating or avoiding the project's contribution to any significant cumulative effects.

To identify the related projects, the State CEQA Guidelines (15130[b]) recommend either the list or projection approach. This analysis uses the list approach, which entails listing past, present, and probable future projects producing related or cumulative effects, including, if necessary, those

projects outside the control of WSAFCA. NEPA does not provide specific guidance as to how to conduct a cumulative effect assessment; however, the list approach has been effective at disclosing cumulative effects under NEPA.

A list of past, current, and probable future projects was compiled for the cumulative setting. These projects (cumulative projects) include other flood control projects affecting the Sacramento River, recreation projects in the region, restoration and other water-related projects in and near the Sacramento River that could affect fish or vegetation on the waterside of levees, and development in the West Sacramento area that could result in effects and benefits similar to those of the WSLIP. Other cumulative projects considered include:

- potential flood protection projects requesting Section 408 approval,
- City of West Sacramento development projects, and
- projects affecting fish and wildlife that use the WSLIP area.

In addition, regional plans were reviewed to characterize development trends and growth projections in Yolo County. These projects are considered with the WSLIP to determine if the combined effects of all of the projects would result in significant cumulative effects.

6.2.3 Projects Considered for the Cumulative Assessment

6.2.3.1 Flood Protection Projects

According to the CEQ regulations, when determining the scope of the action assessment, similar actions must be considered. Similar actions are defined as actions that, when viewed with other reasonably foreseeable or proposed agency actions, have similarities that provide a basis for evaluating their environmental consequences together, such as common timing or geography. An agency may wish to analyze these actions in the same environmental assessment. It should do so when the best way to assess adequately the combined effects of similar actions or reasonable alternatives to such actions is to treat them in a single environmental assessment (40 CFR §1508.25[a][3]). (Council on Environmental Quality 1997.)

The following descriptions of related or similar flood protection projects include those that are under active consideration, have been proposed, or have some form of environmental documentation complete. In addition, these projects have the potential to affect the same resources and fall within the same geographic scope and are therefore to be cumulatively considered with the WSLIP. In particular, those resources are biological resources (riparian habitat and wildlife disturbance), hydrology, and geomorphology. The geographic scope of consideration for effects on those resources is the Sacramento Valley region and Sacramento River system, respectively.

6.2.3.1.1 West Sacramento Levee Improvements Program Early Implementation Projects

Along with the WSLIP, WSAFCA launched a parallel process for identifying smaller-scale improvements that may be candidates for EIPs to address urgent needs and can be planned and designed in advance of or concurrent with the overall program. Essentially, these projects cover critical areas where the levee deficiency is well-defined and the most suitable treatments are known. The I Street Bridge project constructed in 2008 was one such example and the CHP Academy and The Rivers EIPs analyzed in this document are additional examples.

6.2.3.1.2 Sacramento Area Flood Control Agency Levee Integrity Program

SAFCA's long-term program to improve the Natomas Basin levee system is described in Section 1.6.

6.2.3.1.3 Upper Yuba River Levee Improvement Project

The Upper Yuba River Levee Improvement Project (UYLIP) proposes additional levee improvements to a segment of the upper Yuba River in Yuba County. The proposed improvement includes the installation of slurry walls and seepage berms (from Simpson Lane to the Yuba Goldfields). Previous repairs have occurred on this levee segment. Further studies determined additional work was necessary to provide 200-year flood protection for 40,000 residents in south Yuba County. Environmental review and Section 408 permission for the UYLIP is expected in 2010, and construction is expected to occur in 2010 and 2011.

6.2.3.1.4 Sutter Basin Project

The Sutter Basin Feasibility Study was re-initiated in 2006. The study scope focuses on providing flood damage reduction to the urban areas of Yuba City, Live Oak, Gridley, and Biggs in the Sutter Bypass – Feather River sub-basin and developing a flood warning system for the outlying areas of the sub-basin. Additional study objectives include ecosystem restoration and recreation. The study process involves 6 planning steps that range from problem identification (e.g., geotechnical exploration) to the formulation, evaluation, and selection of alternatives. Problem identification studies are expected to be completed in 2010. Formulation and evaluation of alternatives are expected to begin in 2010. Final environmental documents are expected to be completed in 2012. In addition to the feasibility study, an EIP is under development to improve the west levee of the Feather River from Thermalito Afterbay to south of Yuba City. The EIP is at a 10% level of design.

6.2.3.1.5 Feather River Levee Repair Project

The Feather River Levee Repair Project is a multi-phased levee improvement program on the left bank of the Feather River. It includes approximately 13 miles of levees within the Three Rivers Levee Improvement Authority area in south Yuba County. With the exception of approximately 4 miles of improvements in Phase 4, all other improvements have been constructed. Project features included seepage berms, cutoff walls, and 6-mile setback levee. It reduces flood stages in the river by approximately 1.5 feet and provides 200-year protection to over 40,000 residents.

6.2.3.1.6 Feather River Setback Levee at Star Bend

Levee District No. 1 of Sutter County has constructed the Feather River Setback Levee at Star Bend on the west bank of the Feather River near the eastern boundary of Sutter County. The project replaces a segment of the river's existing levee that currently constricts flood flows in the river and presents an unacceptably high risk for levee failure because of seepage. Construction of the setback levee removes the constriction and reduces water surface elevations in the region.

6.2.3.1.7 West Sacramento Project

The West Sacramento Project is described in Section 1.6.

6.2.3.1.8 Sacramento River Bank Protection Project

The Sac Bank Project is described in Section 1.6.

6.2.3.1.9 Sacramento Urban Levee Program

DWR is evaluating sites similar to the USACE's Sacramento River Bank Protection Project. The state will repair 19 critical erosion sites, one of which is in West Sacramento at RM 55.8.

6.2.3.1.10 Flood Control and Coastal Storm Emergency Act

PL 84-99 is described in Section 1.6.

6.2.3.1.11 North Delta Flood Control and Ecosystem Restoration Project

The purpose of the North Delta Flood Control and Ecosystem Restoration Project is to implement flood control improvements in the northeast Delta in a manner that benefits aquatic and terrestrial habitats, species, and ecological processes. The North Delta project area includes the North and South Fork Mokelumne Rivers and adjacent channels downstream of I-5 and upstream of the San Joaquin River. Solution components being considered for flood control include bridge replacement, setback levees, dredging, island bypass systems, and island detention systems. The project will include ecosystem restoration and science actions in this area, and improving and enhancing recreation opportunities. In support of the environmental review process, a notice of preparation (NOP)/NOI was prepared and public scoping was held in 2003. An EIR was prepared in 2008, but the project is not currently funded for implementation.

6.2.3.1.12 CALFED Levees Program

The goal of the CALFED Levees Program is to uniformly improve Delta levees by modifying cross sections, raising levee height, widening levee crowns, flattening levee slopes, or constructing stability berms. Estimates predict that 520 miles of levees need improvement and maintenance to meet the PL 84-99 standard for Delta levees. The program continues to implement levee improvements throughout the Delta, including the south Delta area.

6.2.3.2 Potential Projects Requesting Section 408 Approval

A number of projects in the Central Valley may request Section 408 approval. Table 6.2 below summarizes potential projects with Section 408 requests. These projects are listed for context.

Table 6-2. Potential Projects Requesting Section 408 Approval

Project	Lead Agency/Agencies	Estimated Date for Section 408 Permission
West Sacramento EIPs 2011	WSAFCA	Summer 2010
RD 17 100-year Seepage Repair Project	RD 17, San Joaquin County	Late 2010
River Islands Levee Alteration	City of Lathrop	Late 2010
Natomas Levee Improvement Project	SAFCA	Winter/Spring 2010
Upper Yuba River Levee Improvement Project	TRLIA	Summer 2010/-mid-2011

6.2.3.3 Relevant Land Use Plans

Relevant land use plans are included to assess past, present, or reasonably foreseeable development actions in the city that may affect the same resources as the WSLIP, or provide for the restoration, preservation, or enhancement of those resources.

6.2.3.3.1 Yolo Natural Heritage Program Habitat Conservation Plan

The Yolo Natural Heritage Program is a county-wide Natural Communities Conservation Plan/Habitat Conservation Plan for the 653,629-acre planning area that provides habitat for many special-status and at-risk species found in five dominant habitats/natural communities. The Yolo Natural Heritage Program will describe the measures that will be undertaken to conserve important biological resources, obtain permits for urban growth and public infrastructure projects, and continue Yolo County's rich agricultural heritage (Yolo Natural Heritage Program 2008).

6.2.3.3.2 City of West Sacramento General Plan

The *City of West Sacramento General Plan* consists of two documents: the *General Plan Background Report* and the *General Plan Policy Document*. The *General Plan Background Report* inventories and analyzes existing conditions and trends in West Sacramento. The *Background Report*, which provides the formal supporting documentation for general plan policy, addresses 11 subject areas: land use, housing, population, economic conditions and fiscal considerations, transportation and circulation, public facilities and services, cultural and recreational resources, natural resources, health and safety, urban structure and design, and child care. The *Background Report* also includes as an appendix the *West Sacramento General Plan Community Concerns Summary Report* prepared following the issue identification process carried out in early 1988. The *City of West Sacramento General Plan Policy Document* includes the goals, policies, standards, implementation programs, quantified objectives, land use diagram, and circulation plan diagram that constitute the formal policy of the City of West Sacramento for land use, development, and environmental quality (City of West Sacramento 2000).

6.2.3.3.3 Washington Specific Plan

Adopted in 1996, the *Washington Specific Plan* area covers the northeast area of the City of West Sacramento. The EIP site lies within the plan area. The area includes plans for mixed use, residential, and commercial development. The CalSTRS building is currently under construction under the plan. It is constructed adjacent to and behind the Sacramento River levee, just south of the EIP project site (City of West Sacramento 1996).

6.2.3.3.4 Triangle Plan

Adopted in 1993, the *Triangle Plan* includes primarily mid-rise to high-rise office, high-density multiple family residential, ancillary retail, government, and institutional uses. Development is proposed to occur through 2012. The *Triangle Plan* outlines the creation of a mixed-use community of local and regional significance. The plan area is south of the project site with the Sacramento River as its eastern border (City of West Sacramento Department of Community Development 2000).

6.2.3.3.5 Southport Framework Plan

The Southport Framework Plan was adopted in 1995. Southport is a 7,180-acre site located in the southern portion of the city of West Sacramento. It is bounded by the DWSC on the north and west, the Sacramento River on the east, and the city limits on the south. Proposed land use in this area includes a mixture of residential, commercial, industrial, public/quasi-public, and parks and open space uses. It outlines provisions for 14,050 residential dwelling units, 17.2 million square feet of commercial uses, 21.1 million square feet of office/business park, 7.7 million square feet of industrial uses, 544 acres of public/quasi-public uses, and 915 acres of parks and open spaces at build out. The Southport Framework Plan was developed to provide an overall vision for the development of Southport with a goal of encouraging a development pattern that is an alternative to urban sprawl.

6.2.3.4 City of West Sacramento Development Projects

City development projects that have the potential to affect similar resource areas such as biological resources, air, and noise have been included for analysis.

6.2.3.4.1 Sacramento Riverfront Master Plan Improvement (River Walk)

This development will create a riverfront promenade, extending from The Rivers development on the north to the Stone Locks near the Port of Sacramento. The first three phases of the park, which extends from the Tower Bridge to the I Street Bridge, are completed. Phase 4 plans are to continue the pavement of the top of the levee to the Broderick Boat Ramp. Phase 5 of the riverfront improvements includes a promenade along the Triangle (described above), which is from the Tower Bridge to the Pioneer Bridge. The City currently also has a Resources Agency grant for Phase 5A of the project that expires in May 2011. Phase 6 will continue the River Walk pathway to Pioneer Bluff.

6.2.3.4.2 California Indian Heritage Center

The California Indian Heritage Center is described in Section 2.6.1.4.2.

6.2.3.4.3 Barge Canal Redevelopment

The City plans to further and enhance current use of the barge canal area for aquatic recreational activities, such as sailing, rowing, kayaking, and canoeing, and supports the establishment of a multi-use aquatic facility along the barge canal. Aquatic parks, boat houses, docks, and other support facilities for boating shall be deemed compatible uses along the DWSC and the barge canal within all land use designations. The City also promotes the development of important visual and scenic areas along the riverfront and barge canal for public access, including water-related activities and possible development of high-intensity and high-density urban uses.

6.2.3.4.4 City of West Sacramento Public Projects

The City of West Sacramento has a 25-year Capital Improvement Program that began in 2005. There are several public projects that are projected to occur over the next 20 years, depending on available funding. These projects are:

- new construction and improvements to bicycle, pedestrian, and transit facilities;

- roadway capacity improvements, including street widening of streets and interchange improvements;
- roadway signal and lighting improvements;
- landscape plantings and street and sidewalk maintenance;
- improvements and maintenance to water treatment, supply, storage, and pumping facilities;
- improvements to sanitary sewer and storm drainage facilities; and
- new construction and maintenance of municipal buildings such as City Hall, fire stations, and police stations.

6.2.3.4.5 City of West Sacramento Private Projects

Several private projects in the city of West Sacramento are in various stages of development and could occur over the next 20 years. Each of these projects fall within a specific plan area (as described above in Section 6.2.3.3, Relevant Land Use Plans). In the Triangle/Bridge District, there are two proposed projects:

- **Fulcrum Capital Properties.** This is a 58-acre site with approximately 3.6 million square feet of commercial (office & retail uses) and up to 2,787 housing units proposed for development.
- **River Edge.** This is a 15-acre site with a mixture of uses proposed for development, including 791 residential units, 84,480 square feet of retail space, and 30,000 square feet of office space.

In the Southport Framework Plan area there are five proposed projects:

- **Yarbrough**. The Yarbrough project is proposed to include approximately 3,004 residential units, 150,000 square feet of retail uses, up to 25,000 square feet of office development, up to 40 live/work residential units, and up to 40,000 square feet of community facilities.
- **River Park.** The River Park project is proposed to include approximately 2,286 residential units, 50,000 square feet of commercial space, and a 40 acre regional park site with community facilities.
- **Liberty.** Specific details regarding the Liberty project are still under development but this project would likely be similar to that of Yarbrough or River Park.
- **Stone Lock District.** The Stone Lock District project is proposed to include up to 2,500 residential units, up to 800 hotel rooms, up to 890,000 square feet of retail space, up to 1.7 million square feet of office space, and 60 acres of parks and open space.
- **Seaway International Trade Center.** Specific detail regarding the Seaway International Trade Center are still under development, but this project would likely propose large-scale industrial and commercial development.

6.2.3.4.6 City of West Sacramento Parks Master Plan

The Parks Master Plan, prepared in 2003, outlines the City's goals and policies with regard to the provision of parks and related recreational facilities for West Sacramento residents and provides an inventory of current facilities (SmithGroup 2003). As of April 2006, the City had approximately 145 acres of developed parkland (City of West Sacramento 2005a). Based on the estimated 2007 population of 44,928, this represented an 80-acre shortfall from the standard of 5 acres per 1,000

residents established in the general plan. Based on this ratio, it is estimated that by 2025 population growth in West Sacramento would require the City to have a total of 375 acres of parkland available in order to meet this standard. The Parks Master Plan targets several areas as particularly well-suited for park development, including several locations on the city's waterfront (SmithGroup 2003).

6.2.3.5 Projects Affecting Fish and Wildlife that Use the WSLIP Study Area

As described in Sections 3.8, 3.9, and 3.10, the primary long-term effects on vegetation, fish and wildlife are related to the removal of vegetation in compliance with the USACE levee vegetation policy. Regarding wildlife, this could contribute to a cumulative impact when combined with other projects that adversely affect habitat for wildlife that use the West Sacramento levee vegetation. Regarding fish, this could contribute to a cumulative impact when combined with other projects within the geographic range of the fish that would be affected. As such, this list includes projects that could also adversely affect the same species of fish or wildlife that would be affected by vegetation removal under the WSLIP.

6.2.3.5.1 CALFED Ecosystem Restoration Program

The goals of the CALFED Ecosystem Restoration Program are to:

- recover 19 at-risk native species and contribute to the recovery of 25 additional species;
- rehabilitate natural processes related to hydrology, stream channels, sediment, floodplains and ecosystem water quality;
- maintain and enhance fish populations critical to commercial, sport and recreational fisheries;
- protect and restore functional habitats, including aquatic, upland and riparian, to allow species to thrive;
- reduce the negative effects of invasive species and prevent additional introductions that compete with and destroy native species; and
- improve and maintain water and sediment quality to better support ecosystem health and allow species to flourish.

The Ecosystem Restoration Program, which is divided into the Sacramento, San Joaquin, and Delta and Eastside Tributary regions, includes the following kinds of actions:

- develop and implement habitat management and restoration actions, including restoration of river corridors and floodplains, reconstruction of channel-floodplain interactions, and restoration of Delta aquatic habitats;
- restore habitat that would specifically benefit one or more at-risk species;
- implement fish passage programs and conduct passage studies;
- continue major fish screen projects and conduct studies to improve knowledge of their effects;
- restore geomorphic processes in stream and riparian corridors;
- implement actions to improve understanding of at-risk species;

- develop understanding and technologies to reduce the effects of irrigation drainage on the San Joaquin River and reduce transport of contaminant (selenium) loads carried by the San Joaquin to the Delta and the Bay; and
- implement actions to prevent, control, and reduce effects from non-native invasive species.

Ecosystem Restoration Program actions contribute to cumulative benefits on fish and wildlife species, habitats, and ecological processes.

6.2.3.5.2 Bay Delta Conservation Plan

The Bay Delta Conservation Plan provides for the recovery of endangered and sensitive species and their habitats in the Delta in a way that also provides for the protection and restoration of water supplies. The plan will identify and implement conservation strategies to improve the overall ecological health of the Delta; identify and implement more ecologically friendly ways to move fresh water through or around the Delta; address toxic pollutants, invasive species, and impairments to water quality; and provide a framework and funding to implement the plan over time.

Alternatives being evaluated include conveyance options using the through-Delta, peripheral aqueduct. The restoration options include various degrees of restoration in the Delta and Suisun Marsh. The final plan and the EIS/EIR are expected to be complete in 2010. The Bay Delta Conservation Plan could contribute to beneficial cumulative impacts by increasing suitable habitat for fish and wildlife species.

6.2.4 Cumulative Effects by Resource

The following section describes the potential contribution to cumulative effects on each resource.

6.2.4.1 Flood Control and Geomorphic Conditions

The proposed program could contribute to cumulative effects on flood control and geomorphic conditions resulting from a levee raise, levee setback, or seepage control treatment. As described in Section 3.2, Flood Control and Geomorphic Conditions, levee raises may cause slight increases in upstream water surface elevations and the proposed levee setback may cause slight increases in downstream elevations and flows. Additionally, seepage control treatments may transfer seepage risk to areas adjacent to the treatment.

Hydraulic modeling was used to determine some of the cumulative effects of levee raises, including flood walls and setbacks. Although a slight change in upstream and downstream conditions is expected to result from program alternatives, this change is less than significant.

Based on the quantitative results from the 2009 MBK Engineers modeling effort, upstream water levels would not be significantly affected by the proposed levee raises or other levee improvements either, assuming that all upstream levee strengthening components are eventually implemented.

Levee raises or setbacks and installation of stop logs or floodwalls could represent an unacceptable transfer of flood risk to adjacent or downstream levee districts. However, as described in MBK Engineers (2009), modeling effort for the WSLIP, raising and strengthening portions the Federal project levee system protecting West Sacramento and implementing in-channel erosion protection measures would not result in any significant hydraulic effects on other sub-basins protected as part of the Flood Control Project. Furthermore, these improvements would be consistent with the

principles that have guided the management of the Flood Control Project over the past century and with the policies adopted by the state legislature calling for an immediate and comprehensive effort to increase the level of flood protection provided to West Sacramento and the other urban areas within the Flood Control Project.

Restoration in the Yolo Bypass as proposed in the current Bay Delta Conservation Plan, Delta Vision, and other projects would further increase the flood capacity of the Sacramento River downstream of West Sacramento. It is also important to note that many of the areas adjacent to the West Sacramento levees (excluding the City of Sacramento), are rural and have been designed to flood as part of the overall Sacramento River flood control operation. As such, it is not expected that there would be a significant cumulative effect related to the WSLIP.

With respect to mean sea-level change and its effects on the program area, the WSLIP program area is relatively insensitive to the rates of sea-level rise. Of all the scenarios analyzed, only the high sea-level rise rate 100 years after the project is constructed shows greater than one-tenth of a foot stage increase in the Sacramento River, Yolo Bypass, or Sacramento Bypass in the WSLIP program area (MBK Engineers 2009b).

The Port of West Sacramento and the Deep Water Ship Channel see larger increases due to sea-level rise. The Deep Water Ship Channel is primarily backwater controlled and is hydraulically connected to the rest of the flood system fairly close to the sea (i.e., North Delta). The WSLIP design for the Deep Water Ship Channel indicates there is adequate freeboard available to accommodate a water surface increase of the magnitudes reported herein due to sea-level rise and still maintain the minimum project design freeboard of three feet (MBK Engineers 2009b).

6.2.4.2 Water Quality and Groundwater Resources

No groundwater resources would be affected by the WSLIP and, therefore, there would be no cumulative effects. The proposed treatments could affect water quality during construction by increasing turbidity, thus increasing the potential for and accidental release of hazardous materials. Cumulative effects could occur if other projects were constructed at the same time. Many of the West Sacramento development projects and other levee improvements by SAFCA could contribute to localized and temporary effects on water quality. As described in the water quality section, many minimization measures, including a SWPPP, would be implemented, turbidity would be monitored during construction to ensure it stays within the acceptable level identified by the RWQCB, and NPDES permit and WDRs would be obtained to limit discharge into the water table. These minimization measures are standard construction practices and it is assumed that other projects would also implement them. On completion of construction, no additional effects on water quality would occur as part of the WSLIP. As such, there would be no significant cumulative effect.

6.2.4.3 Geology, Seismicity, Soils, and Mineral Resources

The WSLIP could result in both beneficial and significant effects on geology, seismicity, and soils. There would be no effect on mineral resources, and therefore no cumulative effects associated with the WSLIP. Other earth-moving activities in the WSLIP area, such as development, could change the stability of soils, increase erosion and sedimentation, and expose structures to groundshaking and liquefaction. Soil stability is addressed through engineering design of structures, including levees, and ground-disturbing activities are required to stabilize soils upon completion of construction or even between stages of construction. As such, no significant cumulative effects related to soil

stability are anticipated. A cumulative increase in erosion and sedimentation could occur if other levee improvement projects on the Sacramento River are occurring at the same time. The potential for erosion and sedimentation resulting from the WSLIP and other projects is limited by minimization measures and implementation of a SWPPP. Any cumulative effect would be temporary and minimal, and therefore less than significant. The WSLIP replaces or upgrades existing flood control facilities (i.e., levees) and there would be no change in risks due to seismicity. However, there could be cumulative effects related to construction of structures that could be subject to seismic activity. The program area is not located within an active seismic area, and therefore any cumulative increase in risk related to groundshaking would be less than significant.

6.2.4.4 Transportation and Navigation

Construction activities associated with the WSLIP have the potential to result in short-term disruptions to roadways, including closures, increases in emergency response time and road hazards, effects on alternate transportation modes, disruption to navigation, temporary loss of service to railroads, and decreases in LOS for roads accessed or used for detours during construction. Combined with other projects in West Sacramento and along the Sacramento River, there could be significant cumulative effects on transportation if the WSLIP and other projects are implemented at the same time. Specifically, cumulative effects would occur if projects required closing or detours on multiple major roadways at the same time resulting in decreased access to areas within West Sacramento or a cumulative LOS lower than Level C or D, depending on the location of the road (See Section 3.5, Transportation and Navigation for a description of where these standards apply). With implementation of the environmental commitment to coordinate with the City to ensure minimal overlap in disturbances to traffic during WSLIP construction, these effects would be less than significant. In addition, the WSLIP may result in cumulative effects on railroad lines and services if the WSLIP and other projects that would require temporary closure of railroad tracks were implemented at the same time. WSAFCA will implement the environmental commitment to coordinate construction periods with railroad service officials to minimize potential effects, but dependent upon construction conditions, cumulative effects to railroad transportation could still be significant and unavoidable. Cumulative navigation effects could occur, but the WSLIP's contribution to these effects would be minimal because waterside work would be limited to the area adjacent to the levee. The river is wide enough to accommodate boat and other navigational traffic in the channel during construction and program activities would not result in navigability changes once construction is complete. Other projects that would affect navigability in the Sacramento River are also not likely to change access due to the river's width. No significant cumulative effects would occur.

6.2.4.5 Air Quality and Climate Change

The WSLIP would result in temporary construction-related emissions that would be mitigated by reducing vehicle and equipment emissions and implementing a fugitive dust plan. Other projects occurring in the YSAQMD at the same time as WSLIP construction would result in cumulative effects that would be significant, particularly ROG, NO_x, and PM10. It is expected that projects generating these pollutants would also minimize emissions through dust control and vehicle emissions control. However, there could still be a significant unavoidable cumulative effect.

Additionally, the project combined with other projects would result in a cumulative increase in greenhouse gas emissions. Even with emissions reduction mitigation that would be incorporated into the WSLIP and other projects, this cumulative effect is significant and unavoidable.

6.2.4.6 Noise

The WSLIP would result in substantial increases in noise levels and vibration at sensitive receptors during construction. Other projects in the vicinity of these receptors occurring at the same time as the WSLIP could result in cumulative effects. Because construction noise would be temporary and highly localized, the WSLIP is not anticipated to make a cumulatively considerable contribution to noise effects in the program area.

Similarly, permanent noise increases associated with WSLIP relief well pumps near sensitive receptors combined with other noise-increasing activities could result in a cumulative effect. Mitigation Measure NZ-MM-3 would help control pump noise. Because the pumps would be designed to minimize noise at these receptors, the WSLIP's contribution to this cumulative effect is not considerable, and this cumulative effect is not significant.

6.2.4.7 Vegetation and Wetlands

The WSLIP would result in direct loss of vegetation as a result of construction and implementation of the USACE policy of removing vegetation from the levee prism. Implementation of this policy along all of the Sacramento River levees would result in a significant cumulative effect, to which the WSLIP would make a considerable contribution. Some of the improvements proposed under the WSLIP and other projects would expand the floodplain within the levee and provide opportunities for habitat restoration. Although there could be limited opportunities to restore or preserve vegetation in areas that are not within the jurisdictional levee prism, the majority of the Sacramento River levees, especially in the West Sacramento area, do not have areas suitable for vegetation under the USACE policy. Restoration activities in the Delta and San Joaquin River could restore some of the vegetation lost as a result of projects along Sacramento River, but there would still be a substantial net loss. This would result in a significant cumulative effect that cannot be mitigated. This cumulative effect would be significant and unavoidable.

Similarly, the levee improvements could result in loss of wetlands. The WSLIP includes mitigation to ensure no net loss of wetlands and therefore there would be no considerable contribution to any cumulative effects on wetlands that may occur as a result of implementing other projects.

6.2.4.8 Fisheries and Aquatics

Most of the WSLIP treatments would result in construction-related degradation of fish habitat as a result of sedimentation and turbidity, accidental release of contaminants, noise, vibrations, or other disturbances. Combined with other projects occurring near the WSLIP, there could be significant cumulative effects. The WSLIP's contribution to these cumulative effects is not considerable because it would be temporary and minimized by implementation of a SWPPP and limiting construction activities to times when species are not present.

A few of the improvements would result in permanent loss or degradation of habitat, primarily through the removal of vegetation per the USACE policy or placement of riprap on the waterside of levees. Other levee projects along the Sacramento, Yuba and Feather Rivers would result in similar losses. Restoration activities in the Sacramento River, Delta, and San Joaquin River, including construction of levee setbacks, could offset loss of habitat for the fish that would be affected by the WSLIP. However, there would still be a substantial net loss of habitat, and this cumulative effect is significant and unavoidable.

6.2.4.9 Wildlife

The WSLIP would result in some direct take of species, which would be mitigated on or off site in coordination with the resource agencies. The primary cumulative effect on wildlife is related to removal of habitat. As described above under vegetation and wetlands and fisheries and aquatics, this effect would significant and unavoidable because it would occur along the entire Sacramento River levee system and there are limited opportunities to offset this loss. Additionally, many of the species that would be affected by the WSLIP and other similar projects rely on riparian or other habitat associated with the river system. The direct loss of species can be offset through coordination with resource agencies. Because these species are protected under applicable state and Federal laws, other projects would also minimize take and compensate for loss of species and their habitats. However, the WSLIP would result in a significant and unavoidable cumulative effect resulting from the removal of vegetation from the levees.

6.2.4.10 Land Use and Agriculture

Some of the WSLIP treatments could result in the conversion of some land use types to levee. Overall, the land use designation changes would be negligible as described in Section 3.11, Land Use and Agriculture. However, in areas adjacent to important farmland, a conversion of up to 111 acres could occur. This acreage accounts for approximately 0.0284% of the 390,250 acres of important farmland in Yolo County. Conversion of agricultural land in Yolo County is a primary concern related to land use and it is a significant cumulative impact. However, the WSLIP's contribution to this cumulative impact is not considerable.

6.2.4.11 Socioeconomics

Implementation of the WSLIP could result in temporary disruptions to agricultural and local business activities during construction, a permanent decrease in agricultural production related to the removal of farmland (as described above), and growth in West Sacramento as a result of improved levee stability. The permanent removal of farmland would be minimal compared to the total acres of farmland in the region as described above. Although this is a significant impact in Yolo County, the WSLIP's contribution would not be considerable. Similarly, the temporary disruption to agricultural and local business activities is not expected to contribute considerably to a cumulative impact.

6.2.4.12 Environmental Justice

The WSLIP would not result in environmental justice effects and, therefore, there would be no cumulative effect.

6.2.4.13 Visual Resources

The WSLIP would result in temporary changes in the visual quality of construction areas and access roads as a result of construction activities and equipment in areas that do not normally include construction-associated views. This effect would make a considerable contribution to a cumulative effect if other projects were occurring at the same time and affecting the same viewer groups along the Sacramento River corridor. This cumulative effect would be significant and unavoidable.

The primary long-term effect on visual resources is related to the USACE vegetation removal policy. The Sacramento River corridor includes extensive mature riparian and landscape vegetation. In

addition to construction-related vegetation removal, the recent USACE levee maintenance requirements prevent the replanting of any woody vegetation on these levees. This vegetation is characteristic of the Sacramento River region and is a highly desirable visual resource. Removal of this characteristic riparian vegetation and mature landscaping would greatly degrade the visual character and quality of the region. The removal of vegetation within the study area, in addition to the region-wide levee improvement projects, is considered a cumulatively significant and unavoidable effect on visual resources.

6.2.4.14 Recreation

The WSLIP would result in both beneficial and negative effects on recreation. Negative effects would occur as a result of vegetation removal and other construction activities that could disrupt recreation in the channels or along levees, bikepaths, or other trails. Other projects affecting the same channels, bikepaths, or trails could result in a cumulative effect on recreation. This cumulative effect would be less than significant because effects would be temporary and localized, and other facilities would be available for use during construction. The removal of vegetation, however, could result in a significant cumulative effect related to reduction of fish habitat and shade that enhances fishing recreation or other activities that rely on or are enhanced by vegetation on the levee. As this would occur throughout the Sacramento River levee system, this cumulative effect is significant and unavoidable.

Beneficial recreation effects include the addition of recreational facilities, including docks and fishing piers, formal park facilities, habitat zones, a continuous recreational trail, an amphitheater, an extension of the Riverwalk Promenade, and improvements to Bryte Park as part of the WSLIP. The City has also planned for the development of additional recreational facilities. This would be a beneficial cumulative effect on recreation in the West Sacramento area.

6.2.4.15 Utilities and Public Services

The WSLIP combined with other proposed projects could result in cumulative effects related to disruption to utility services, increased rates of landfill use, and expansion of drainage facilities. Cumulative effects related to utility service and landfill use would occur only during construction. Utility service disruptions would be avoided by implementation of Mitigation Measure PUB-MM-1: Verify Utility Locations, Coordinate with Utility Providers, Prepare a Response Plan, and Conduct Worker Training. These measures are standard and it is expected that other projects occurring at the same time as the WSLIP would minimize their potential for disruption similarly. Effects on landfill capacity are not expected to be considerable because much of the materials removed from existing levees would be reused, construction would be temporary, and the Central Landfill has plenty of capacity (see Section 3.16, Utilities and Public Services). Similarly, drainage facilities would not be expanded as relief wells would only produce up to 70 gallons per minute. As such, there would be no significant cumulative effect.

6.2.4.16 Public Health and Environmental Hazards

The WSLIP has the potential to slightly increase risks to the public during construction as a result of equipment and fuel usage. These risks would be minimized through implementation of the SWPPP and other environmental commitments. As these are standard practice for construction projects, it is expected that other projects would implement them and the overall cumulative effect would be less than significant.

The WSLIP would improve flood protection for West Sacramento. It includes all of the flood protection features protecting West Sacramento, but other projects that reduce stress on these levees could result in a beneficial cumulative effect by reducing the overall public risk resulting from levee failure.

6.2.4.17 Cultural Resources

No cumulative effects on cultural resources have been identified. Cultural resources are generally not considered subject to cumulative effects because they are either individually directly or indirectly affected in a way that changes the significance of the property or they are not affected in a way that changes the significance of the property.

It is possible that the project could cause a significant effect on historic properties and unidentified buried archaeological resources, including buried human remains, through possible ground disturbance associated with levee repair, construction, and maintenance activities.

The incorporation of mitigation, and compliance with the existing state and Federal laws and the policies set forth in the *City of West Sacramento General Plan*, the *Yolo County General Plan*, and the *Solano County General Plan* would reduce these effects. The cumulative effect on archaeological and architectural resources would be less than significant.

Chapter 7
Compliance with Applicable Laws, Policies, Plans, and Regulatory Framework

7.1 Introduction

This chapter provides preliminary information on the major requirements for permitting and environmental review and consultation for implementation of the project. Certain local, state, and Federal regulations require issuance of permits before project implementation; other regulations require agency consultation but may not require issuance of any authorization or entitlements before project implementation.

7.2 Regulatory Framework

7.2.1 Federal Requirements

7.2.1.1 National Environmental Policy Act

NEPA is the nation's broadest environmental law, applying to all Federal agencies and most of the activities they manage, regulate, or fund that have the potential to affect the environment. It requires Federal agencies to disclose and consider the environmental implications of their proposed actions. NEPA establishes environmental policies for the nation, provides an interdisciplinary framework for Federal agencies to prevent environmental damage, and contains action-forcing procedures to ensure that Federal agency decision makers take environmental factors into account.

NEPA requires the preparation of an appropriate document to ensure that Federal agencies accomplish the law's purposes. The President's CEQ has adopted regulations and other guidance that provide detailed procedures that Federal agencies must follow to implement NEPA.

This document is the instrument for NEPA compliance for the WSLIP and proposed EIPs under the USACE's authority, as described in Chapter 1.

7.2.1.2 Federal Endangered Species Act

Section 7 of the ESA requires Federal agencies, in consultation with USFWS and/or NMFS, to ensure that their actions do not jeopardize the continued existence of endangered or threatened species, or result in the destruction or adverse modification of the critical habitat of these species. The required steps in the Section 7 consultation process are as follows.

- Agencies must request information from USFWS and/or NMFS on the existence in a project area of special-status species or species proposed for listing.
- Agencies must initiate formal consultation with USFWS and/or NMFS if the proposed action may adversely affect special-status species.

The WSLIP and proposed EIPs may affect special-status species. USACE and WSAFCA are in coordination with USFWS and NMFS and consultation will be initiated under Section 7 before publication of the Draft EIS/EIR.

7.2.1.3 Migratory Bird Treaty Act

The MBTA implements a series of international treaties that provide for migratory bird protection. The MBT A authorizes the Secretary of the Interior to regulate the taking of migratory birds; the act provides that it is unlawful, except as permitted by regulations, "to pursue, take, or kill any migratory bird, or any part, nest or egg of any such bird..." (16 USC 703). This prohibition includes both direct and indirect acts, although harassment and habitat modification are not included unless they result in direct loss of birds, nests, or eggs. The current list of species protected by the MBT A includes several hundred species and essentially includes all native birds. Permits for take of non-game migratory birds can be issued only for specific activities, such as scientific collecting, rehabilitation, propagation, education, taxidermy, and protection of human health and safety and personal property.

Compliance with the MBTA would be addressed through compliance with the ESA and CESA. The WSLIP incorporates mitigation measures that would help ensure that construction activities do not result in the take of migratory birds, as discussed in Section 3.10, Wildlife, and Chapters 4 and 5 for the proposed EIPs.

7.2.1.4 Bald Eagle Protection Act

The Bald Eagle Protection Act provides for the protection of the bald eagle and the golden eagle by prohibiting, except under certain specified conditions, the take, possession, and commerce of such birds.

The WSLIP study area does not contain bald eagle or golden eagle nesting habitat, and the program would not result in the take of bald or golden eagles. The WSLIP incorporates mitigation measures that would ensure that construction activities do not result in the take of any raptors, as discussed in Section 3.10, Wildlife, and Chapters for and 5 for the proposed EIPs.

7.2.1.5 Clean Water Act Section 404, 404(b)(1) Guidelines, and Section 401

7.2.1.5.1 Section 404

Section 404 of the CWA requires that a permit be obtained from USACE for the discharge of dredged or fill material into "waters of the United States, including wetlands."

Waters of the United States include wetlands and lakes, rivers, streams, and their tributaries. *Wetlands* are defined for regulatory purposes, at 33 CFR § 328.3 as:

> (1) All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of tide; (2) All interstate waters, including interstate wetlands; (3) All other waters such as intrastate lakes, rivers, streams, mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce; (4) All impoundments of waters otherwise defined as waters of the United States under the definition; (5) Tributaries of waters identified in paragraphs 1–4 in this section; (6) The territorial seas; and (7) Wetlands adjacent to waters identified in paragraphs 1–6 in this section.

CWA Section 404(b) requires that USACE process permits in compliance with guidelines developed by EPA. These guidelines (404[b][1] Guidelines) require that there be an analysis of alternatives available to meet the project purpose and need, including those that avoid and minimize discharges of dredged or fill materials in waters. Once this first test has been satisfied, the project that is permitted must be the least environmentally damaging practicable alternative before USACE may issue a permit for the proposed activity.

(Note: Section 404 does not apply to authorities under the Rivers and Harbors Appropriation Act of 1899, except that some of the same waters may be regulated under both statutes; the USACE typically combines the permit requirements of Section 10 and Section 404 into one permitting process.)

Coordination is in process with USACE regulatory staff regarding the presence of waters of the United States in the WSLIP study area and that of the proposed EIPs. A wetland delineation has been submitted for verification and jurisdictional determination. The draft delineation indicates that the proposed EIPs would not affect waters of the United States and a permit is not required. A permit will be applied for if the verification indicates otherwise or if the project changes to affect waters of the United States, and appropriate revisions under NEPA will be made in Final EIS.

7.2.1.5.2 Section 401

Under the CWA Section 401, applicants for a Federal license or permit to conduct activities that may result in the discharge of a pollutant into waters of the United States must obtain certification from the state in which the discharge would originate or, if appropriate, from the interstate water pollution control agency with jurisdiction over affected waters at the point where the discharge would originate. Therefore, all projects that have a Federal component and may affect state water quality (including projects that require Federal agency approval [such as issuance of a Section 404 permit]) must also comply with CWA Section 401. In California, the authority to grant water quality certification has been delegated to the State Water Board, and applications for water quality certification under CWA Section 401 are typically processed by the RWQCB with local jurisdiction. Water quality certification requires evaluation of potential impacts in light of water quality standards and CWA Section 404 criteria governing discharge of dredged and fill materials into waters of the United States.

As Section 408 permission for the proposed EIPs constitutes a Federal action that may affect state water quality, a request for certification under CWA Section 401 will be submitted.

7.2.1.6 River and Harbors Appropriation Act of 1899

The River and Harbors Appropriation Act of 1899 addresses activities that involve the construction of dams, bridges, dikes, and other structures across any navigable water, or that place obstructions to navigation outside established Federal lines and excavate from or deposit material in such waters. Such activities require permits from USACE. *Navigable waters* are defined in Section 329.4 of the act as:

> Those waters that are subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. A determination of navigability, once made, applies laterally over the entire surface of the water body, and is not extinguished by later actions or events which impede or destroy navigable capacity.

7.2.1.6.1 Section 9

Section 9 (33 USC § 401) prohibits the construction of any bridge, dam, dike, or causeway across any navigable water of the United States in the absence of congressional consent and approval of the plans by the Chief of Engineers and the Secretary of the Army. Where the navigable portions of the water body lie wholly within the limits of a single state, the structure may be built under authority of the legislature of that state, if the location and plans or any modification thereof are approved by the Chief of Engineers and by the Secretary of the Army.

7.2.1.6.2 Section 10

Section 10 (33 USC § 403) prohibits the unauthorized obstruction or alteration of any navigable water of the United States. This section provides that the construction of any structure in or over any navigable water of the United States, or the accomplishment of any other work affecting the course, location, condition, or physical capacity of such waters, is unlawful unless the work has been authorized by the Chief of Engineers.

7.2.1.6.3 Section 13

Section 13 (33 USC § 407) provides that the Secretary of the Army, whenever the Chief of Engineers determines that anchorage and navigation would not be injured thereby, may permit the discharge of refuse into navigable waters. In the absence of a permit, such discharge of refuse is prohibited. While the prohibition of this section, known as the Refuse Act, is still in effect, the permit authority of the Secretary of the Army has been superseded by the permit authority provided the Administrator, EPA, and the states under Sections 402 and 405 of the CWA, respectively.

As described above (7.2.1.5.1), pending verification, the proposed EIPs would not affect waters of the United States under Section 404 or navigable waters under the Rivers and Harbors Appropriation Act of 1899.

7.2.1.6.4 Section 14

Section 14 (33 USC § 408) requires approval from the Chief of Engineers, or designee, for alterations to certain public works, including Federal project levees, so long as the alteration would not be injurious to the public interest and does not impair the usefulness of the work, such as the levee section proposed for modification by the EIP. Section 408 alterations would include actions that change the hydraulic capacity of the floodway or change the authorized geometry of the Federal project. As described in Chapter 1, WSAFCA is seeking approval under 33 USC § 408, supported by this document.

7.2.1.6.5 Section 208 (33 CFR 208.10)

Section (33 CFR 208.10) authorizes the USACE District Engineer to approve relatively minor, low impact alterations/modifications related to the O&M responsibilities of the non-Federal sponsors, provided these alterations and modifications do not adversely affect the functioning of the project and flood fighting activities. The CHP Academy and The Rivers EIPs are considered to fall under Section 408, as described in the preceding paragraph, the process for which includes and goes beyond the Section 208 District Engineer level to the Chief of Engineers.

7.2.1.7 Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) establishes a management system for national marine and estuarine fishery resources. This legislation requires that all Federal agencies consult with NMFS regarding all actions or proposed actions permitted, funded, or undertaken that may adversely affect essential fish habitat (EFH). EFH is defined as "waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity." The legislation states that migratory routes to and from anadromous fish spawning grounds are considered EFH. The phrase *adversely affect* refers to the creation of any effect that reduces the quality or quantity of essential fish habitat. Federal activities that occur outside of an essential fish habitat but that may, nonetheless, have an impact on essential fish habitat waters and substrate must also be considered in the consultation process.

Under the Magnuson-Stevens Act, effects on habitat managed under the Pacific Salmon Fishery Management Plan must also be considered. The Magnuson-Stevens Act states that consultation regarding essential fish habitat should be consolidated, where appropriate, with the interagency consultation, coordination, and environmental review procedures required by other Federal statutes, such as NEPA, Fish and Wildlife Coordination Act, CWA, and ESA. EFH consultation requirements can be satisfied through concurrent environmental compliance if the lead agency provides NMFS with timely notification of actions that may adversely affect EFH and if the notification meets requirements for essential fish habitat assessments.

As described above under ESA compliance, USACE and WSAFCA are in coordination with USFWS and NMFS and consultation will be initiated under Section 7 before publication of the Draft EIS/EIR and that process will include consideration of and compliance with the Magnuson-Stevens Act to determine effects on EFH. At this time, it is considered that no EFH would be affected.

7.2.1.8 Fish and Wildlife Coordination Act

The Fish and Wildlife Coordination Act in general requires Federal agencies to coordinate with USFWS and state fish and game agencies whenever streams or bodies of water are controlled or modified. This coordination is intended both to promote the conservation of wildlife resources by providing equal consideration for fish and wildlife in water project planning and to provide for the development and improvement of wildlife resources in connection with water projects. Federal agencies undertaking water projects are required to include recommendations made by USFWS and state fish and game agencies in project reports, and give full consideration to these recommendations.

Coordination under the Fish and Wildlife Coordination Act has been funded and will be initiated by USACE for a Coordination Act Report to be prepared. California DFG will be consulted.

7.2.1.9 Farmland Protection Policy Act and Memoranda on Farmland Preservation

Two policies require Federal agencies to include assessments of the potential effects of a proposed project on prime and unique farmland. These policies are the FPPA and the Memoranda on Farmland Preservation, dated August 30, 1976, and August 11, 1980, respectively, from the CEQ. Under requirements set forth in these policies, Federal agencies must determine these effects before taking any action that could result in converting designated prime or unique farmland for non-agricultural purposes. If implementing a project would adversely affect farmland preservation, the

agencies must consider alternative actions to lessen those effects. Federal agencies also must ensure that their programs, to the extent feasible, are compatible with state, local, and private programs to protect farmland. NRCS is the Federal agency responsible for ensuring that these laws and policies are followed.

The WSLIP would potentially result in loss of farmland, depending on the treatment selected. Section 3.11, Land Use and Agriculture, addresses this and proposes mitigation for the potential loss of agricultural land. The CHP Academy and The Rivers EIPs would have no effect on farmland.

7.2.1.10 National Historic Preservation Act

Section 106 of the NHPA requires Federal agencies to evaluate the effects of their undertakings on historic properties, which are those properties listed or eligible for listing on the NRHP. Implementing regulations at 36 CFR Part 800 require that Federal agencies, in consultation with SHPO, identify historic properties within the APE of the proposed project and make an assessment of adverse effects if any are identified. If the project is determined to have an adverse effect on historic properties, the Federal agency is required to consult further with SHPO and the Advisory Council on Historic Preservation to develop methods to resolve the adverse effects. The Section 106 process has five basic steps.

1. Initiate the Section 106 process, including the identification of consulting parties, such as Native American tribes.
2. Identify and evaluate cultural resources to determine whether they are historic properties.
3. Assess the effects of the undertaking on historic properties within the APE.
4. If historic properties may be subject to an adverse effect, the Federal agency, the SHPO, and any other consulting parties (including Native American tribes and the ACHP) continue consultation to seek ways to avoid, minimize, or mitigate the adverse effect. An MOA is usually developed to document the measures agreed upon to resolve adverse effects. Alternatively, the Federal agency may prepare and execute a PA with the aforementioned parties to comply with 36 CFR 800, particularly in the context of complex undertakings that entail years of implementation actions or where the undertaking's effects on historic properties cannot be well characterized during the planning phase.
5. Proceed in accordance with the terms of the MOA or PA.

The efforts taken to identify cultural resources within the APE and any potential effects are discussed in Section 3.18, Cultural Resources. Consultation with SHPO will be initiated by the time of publication of the Draft EIS/EIR.

7.2.1.11 American Indian Religious Freedom Act

The American Indian Religious Freedom Act of 1978 is also applicable to Federal undertakings. This act established "the policy of the United States to protect and preserve for American Indians their inherent right of freedom to believe, express, and exercise the traditional religions, including but not limited to access to sites, use and possession of sacred objects, and the freedom to worship through ceremonial and traditional rites" (Public Law 95-431).

It is not anticipated that actions related to the program will conflict with the American Indian Religious Freedom Act. Consultation with the Native American Heritage Commission and the Sacred

Lands database was negative for findings in the WSLIP area, which is discussed in Section 3.18, Cultural Resources.

7.2.1.12 Wild and Scenic Rivers Act

The Wild and Scenic Rivers Act (16 USC 1271 et seq.) establishes a National Wild and Scenic Rivers System for the protection of rivers with important scenic, recreational, fish and wildlife, and other values. Rivers are classified as wild, scenic, or recreational. The act designates specific rivers for inclusion in the System and prescribes the methods and standards by which additional rivers may be added. The lower American River is included in the system and is designated as Recreational.

None of the internal water features of the program are tributary to the lower American River or any other river included in the system. Therefore, the WSLIP actions would have no effect on Wild or Scenic Rivers.

7.2.1.13 Executive Order 11988 (Floodplain Management)

Executive Order 11988 (May 24, 1977) requires Federal agencies to prepare floodplain assessments for proposed actions located in or affecting floodplains. If an agency proposes to conduct an action in a floodplain, it must to the degree possible avoid short and long term adverse effects associated with the occupancy and the modification of a floodplain and to avoid direct and indirect support of floodplain development whenever there is a reasonable and feasible alternative. If the only reasonable and feasible alternative involves siting in a floodplain, the agency must minimize potential harm to or in the floodplain and explain why the action is proposed in the floodplain.

The WSLIP proposes to improve existing flood protection facilities and does not directly or indirectly propose floodplain development. Please see further discussion in Chapter 6, Growth-Inducing and Cumulative Effects.

7.2.1.14 Executive Order 11990 (Protection of Wetlands)

Executive Order 11990 (May 24, 1977) requires Federal agencies to prepare wetland assessments for proposed actions located in or affecting wetlands. Agencies must avoid undertaking new construction in wetlands unless no practicable alternative is available and the proposed action includes all practicable measures to minimize harm to wetlands. Section 3.8, Vegetation and Wetlands, describes effects on wetlands and mitigation measures for reducing significant effects for the WSLIP. Chapters 4 and 5 provide information specific to the proposed EIPs.

7.2.1.15 Executive Order 12898 (Environmental Justice)

Executive Order 12898 (February 11, 1994) requires Federal agencies to identify and address adverse human health or environmental effects of Federal programs, policies, and activities that could be disproportionately high on minority and low-income populations. Federal agencies must ensure that Federal programs or activities do not directly or indirectly result in discrimination on the basis of race, color, or national origin. Federal agencies must provide opportunities for input into the NEPA process by affected communities and must evaluate the potentially significant and adverse environmental effects of proposed actions on minority and low-income communities during environmental document preparation. Even if a proposed Federal project would not result in significant adverse impacts on minority and low-income populations, the environmental document must describe how Executive Order 12898 was addressed during the NEPA process.

Environmental justice issues are discussed in Section 3.13, Environmental Justice. In summary, the WSLIP and proposed EIPs would not result in any significant effects on minority or low-income populations. In reality, the WSLIP and proposed EIPs would increase flood protection to nearby established diverse communities of mixed income and ethnicity.

7.2.1.16 Executive Order 13007 (Indian Sacred Sites) and April 29, 1994, Executive Memorandum

Executive Order 13007 (May 24, 1996) requires Federal agencies with land management responsibilities to accommodate access to and ceremonial use of Indian sacred sites by Indian religious practitioners and avoid adversely affecting the physical integrity of such sacred sites. Where appropriate, agencies are to maintain the confidentiality of sacred sites. Among other things, Federal agencies must provide reasonable notice of proposed actions or land management policies that may restrict future access to or ceremonial use of, or adversely affect the physical integrity of, sacred sites. The agencies must comply with the April 29, 1994, Executive Memorandum, *Government-to-Government Relations with Native American Tribal Governments*.

Based on the analysis (summarized in Section 3.18, Cultural Resources), no sacred sites would be significantly affected by the implementation of the WSLIP or proposed EIPs.

7.2.1.17 Federal Clean Air Act

The Federal CAA was enacted to protect and enhance the nation's air quality in order to promote public health and welfare and the productive capacity of the nation's population. The CAA requires an evaluation of any Federal action to determine its potential impact on air quality in the project region. California has a corresponding law, which also must be considered during the EIR process.

For specific projects, Federal agencies must coordinate with the appropriate air quality management district as well as with EPA. This coordination would determine whether the project conforms to the CAA and the State Implementation Plan (SIP).

Section 176 of the CAA prohibits Federal agencies from engaging in or supporting in any way an action or activity that does not conform to an applicable SIP. Actions and activities must conform to a SIP's purpose of eliminating or reducing the severity and number of violations of the national ambient air quality standards and in attaining those standards expeditiously. EPA promulgated conformity regulations (codified in 40 CFR § 93.150 *et seq.*).

The potential air quality impacts of the WSLIP resulting from construction (such as equipment emissions and fugitive dust) are discussed in Section 3.6, Air Quality and Climate Change, which analyzes and documents compliance with the CAA. Chapters 4 and 5 provide specific information for the proposed EIPs.

7.2.1.18 Federal Water Project Recreation Act

The Federal Water Project Recreation Act requires Federal agencies with authority to approve water projects to include recreation development as a condition of approving permits. Recreation development must be considered along with any navigation, flood control, reclamation, hydroelectric, or multi-purpose water resource project. The act states that,

> consideration should be given to opportunities for outdoor recreation and fish and wildlife enhancement whenever any such project can reasonably serve either or both purposes consistently.

Recreation effects, such as temporary loss to river access, are described in Section 3.15, Recreation.

7.2.1.19 Resource Conservation and Recovery Act

The Federal Resource Conservation and Recovery Act enables EPA to administer a regulatory program that extends from the manufacture of hazardous materials to their disposal, thus regulating the generation, transportation, treatment, storage, and disposal of hazardous waste at all facilities and sites in the nation.

No materials classified as hazardous are proposed to be used for the WSLIP or proposed EIPs.

7.2.1.20 Comprehensive Environmental Response, Compensation, and Liability Act

CERCLA (also known as Superfund) was passed to facilitate the cleanup of the nation's toxic waste sites. In 1986, the act was amended by the Superfund Amendment and Reauthorization Act Title III (community right-to-know laws). Title III states that past and present owners of land contaminated with hazardous substances can be held liable for the entire cost of the cleanup, even if the material was dumped illegally when the property was under different ownership.

No hazardous waste sites were identified in the WSLIP study area during reconnaissance surveys and record searches (Appendix H).

7.2.1.21 Wildlife Hazards on or Near Airports

The Federal Aviation Administration addresses control of hazardous wildlife in Advisory Circular 150/5200-33B, *Hazardous Wildlife Attractants on or near Airports*. The Federal Aviation Administration provides direction on where public-use airports should restrict land uses that have the potential to attract hazardous wildlife. The Federal Aviation Administration recommends a distance of 10,000 feet separating wildlife attractants and aircraft movement areas. The area within a 10,000-foot radius of the Airport Operations Area is designated as the Critical Zone. The definition of wildlife attractants in Advisory Circular 150/5200-33A includes human-made or natural areas, such as poorly drained areas, retention ponds, agricultural activities, and wetlands. Advisory Circular 150/5200-33A recommends against the use of airport property for agricultural production within a 5-mile radius of the Airport Operations Area unless the income from the agricultural crops is necessary for the economic viability of the airport.

The Federal Aviation Administration has a regulatory interest in managing wildlife attractants within 5 miles of the edge of the Sacramento County Airport's Area of Operations. If potential borrow sites are identified within the 10,000-foot Airport Critical Zone, management of the grasslands created by borrow operations would be consistent with the Airport's *Wildlife Hazard Management Plan* (Sacramento County Airport System 2007).

7.2.1.22 Sustainable Fisheries Act

In response to growing concern about the status of United States fisheries, Congress passed the Sustainable Fisheries Act of 1996 (PL 104-297) to amend the Magnuson-Stevens Fishery Conservation and Management Act (PL 94-265), the primary law governing marine fisheries management in the Federal waters of the United States. Under the Sustainable Fisheries Act, consultation is required by NMFS on any activity that might adversely affect EFH. EFH includes

those habitats that fish rely on throughout their life cycles. It encompasses habitats necessary to allow sufficient production of commercially valuable aquatic species to support a long-term sustainable fishery and contribute to a healthy ecosystem. The Sacramento River has been designated as EFH by the Pacific Fishery Management Council. As described above under ESA compliance, USACE and WSAFCA are in coordination with USFWS and NMFS and consultation will be initiated under Section 7 before publication of the Draft EIS/EIR and that process will include consideration of and compliance with the Magnuson-Stevens Act to determine effects on EFH. At this time, it is considered that no EFH would be affected.

7.2.1.23 Uniform Relocation Assistance and Real Property Acquisition Policies Act

All or portions of parcels within the EIP footprint would need to be acquired to construct either of the action alternatives. Federal, state, local government agencies, and others receiving Federal financial assistance for public programs and projects that require the acquisition of real property must comply with the policies and provisions set forth in the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended in 1987 (42 USC 4601 *et seq*.) (Uniform Act), and implementing regulation, Title 49 CFR Part 24. Relocation advisory services, moving costs reimbursement, replacement housing, and reimbursement for related expenses and rights of appeal are provided for in the Uniform Act.

Program implementation would require acquisition of property to construct levee improvements, and may require displacement of residents.

Property acquisition and relocation services, compensation for living expenses for temporarily relocated residents, and negotiations regarding any compensation for temporary loss of business would be accomplished in accordance with the Uniform Act and California Government Code Section 7267 *et seq*.

7.2.2 State Requirements

7.2.2.1 California Environmental Quality Act

CEQA requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible. The environmental review required imposes both procedural and substantive requirements. At a minimum, an initial review of the project and its environmental effects must be conducted. CEQA's primary objectives are to:

- disclose to decision makers and the public the significant environmental effects of proposed activities,
- identify ways to avoid or reduce environmental damage,
- prevent environmental damage by requiring implementation of feasible alternatives or mitigation measures,
- disclose to the public reasons for agency approval of projects with significant environmental effects,
- foster interagency coordination in the review of projects, and
- enhance public participation in the planning process.

CEQA applies to all discretionary activities proposed to be carried out or approved by California public agencies, including state, regional, county, and local agencies, unless an exemption applies. The act requires that public agencies comply with both procedural and substantive requirements. Procedural requirements include the preparation of the appropriate public notices (including notices of preparation), scoping documents, alternatives, environmental documents (including mitigation measures, mitigation monitoring plans, responses to comments, findings, and statements of overriding considerations), completion of agency consultation and State Clearinghouse review, and provisions for legal enforcement and citizen access to the courts.

CEQA's substantive provisions require agencies to address environmental impacts disclosed in an appropriate document. When avoiding or minimizing environmental damage is not feasible, CEQA requires agencies to prepare a written statement of overriding considerations when they decide to approve a project that will cause one or more significant effects on the environment that cannot be mitigated. CEQA establishes a series of action-forcing procedures to ensure that agencies accomplish the purposes of the law. In addition, under the direction of CEQA, the California Resources Agency has adopted regulations, known as the State CEQA Guidelines, which provide detailed procedures that agencies must follow to implement the law.

This document is the instrument for CEQA compliance for the WSLIP and proposed EIPs under the USACE's authority, as described in Chapter 1.

7.2.2.2 California Endangered Species Act

CESA is similar to ESA but pertains only to state-listed endangered and threatened species. CESA requires state agencies to consult with DFG when preparing documents under CEQA to ensure that the actions of the state lead agency do not jeopardize the continued existence of listed species. CESA directs agencies to consult with DFG on projects or actions that could affect listed species, directs DFG to determine whether there would be jeopardy to listed species, and allows DFG to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. Agencies can approve a project that affects a listed species if the agency determines that there are "overriding considerations;" however, the agencies are prohibited from approving projects that would cause the extinction of a listed species.

Mitigating impacts on state-listed species involves avoidance, minimization, and compensation (listed in order of preference). Unavoidable impacts on state-listed species are typically addressed in a detailed mitigation plan prepared in accordance with DFG guidelines. DFG exercises authority over mitigation projects involving state-listed species, including those resulting from CEQA mitigation requirements.

CESA prohibits the "take" of plant and wildlife species state-listed as endangered or threatened. DFG may authorize take if there is an approved habitat management plan or management agreement that avoids or compensates for impacts on listed species.

Take of state-listed species or substantial degradation of habitat is not presently anticipated during construction or operation of the WSLIP or proposed EIPs, so specific take authorization is not triggered. Effects on wildlife resources are discussed in Section 3.10, Wildlife, and Chapters 4 and 5.

7.2.2.3 Natural Community Conservation Planning Act

The NCCPA (California Fish and Game Code Section 2800 *et seq.*) was enacted to support broad-based planning for effective protection and conservation of the state's wildlife heritage, while continuing to allow appropriate development and growth. The purpose of natural community conservation planning is to sustain and restore those species and their habitat identified by DFG that are necessary to maintain the continued viability of biological communities affected by human changes to the landscape. A Natural Community Conservation Plan identifies and provides for those measures necessary to conserve and manage natural biological diversity within the plan area while allowing compatible use of the land. DFG may authorize the take of any identified species, including listed and non-special-status species, pursuant to Section 2835 of the NCCPA, if the conservation and management of such species is provided for in a Natural Community Conservation Plan approved by DFG.

The program would not affect the take of state-listed species or substantially degrade habitat, so a Natural Community Conservation Plan is not triggered. Effects on biological resources are discussed in Section 3.8, Vegetation and Wetlands; Section 3.10, Wildlife; and Chapters 4 and 5.

7.2.2.4 Section 1602 of the California Fish and Game Code

DFG regulates work that will substantially affect resources associated with rivers, streams, and lakes in California, pursuant to Fish and Game Code Sections 1600 to 1607. Any action from a public project that substantially diverts or obstructs the natural flow or changes the bed, channel, or bank of any river, stream, or lake, or uses material from a streambed must be previously authorized by DFG in a lake or streambed alteration agreement under Section 1602 of the Fish and Game Code. This requirement may in some cases apply to any work undertaken within the 100-year floodplain of a body of water or its tributaries, including intermittent streams and desert washes. As a general rule, however, it applies to any work done within the annual high-water mark of a wash, stream, or lake that contains or once contained fish and wildlife, or that supports or once supported riparian vegetation.

Applications for Streambed Alteration Agreements will be submitted to DFG to authorize the proposed EIPs under Section 1602.

7.2.2.5 Porter-Cologne Water Quality Control Act of 1969

In 1967, the Porter-Cologne Act established the State Water Board and nine RWQCBs as the primary state agencies with regulatory authority over California water quality and appropriative surface water rights allocations. Under this act (and the CWA), the state is required to adopt a water quality control policy and WDRs to be implemented by the State Water Board and nine RWQCBs. The State Water Board also establishes Basin Plans and statewide plans. The RWQCBs carry out State Water Board policies and procedures throughout the state.

Basin Plans designate beneficial uses for specific surface water and groundwater resources and establish water quality objectives to protect those uses. The project has the potential to affect water quality in surface water or groundwater within the project area which is governed by the Central Valley RWQCB.

Section 3.3, Water Quality and Groundwater Resources, describes program water quality effects and mitigation measures and Chapters 4 and 5 address those specific to the proposed EIPs.

7.2.2.6 Central Valley Flood Protection Board Encroachment Permit

The CVFPB (formerly The Reclamation Board) requires an encroachment permit for any non-Federal activity along or near Federal flood damage reduction project levees and floodways or in CVFPB-designated floodways to ensure that proposed local actions or projects do not impair the integrity of existing flood damage reduction systems to withstand flood conditions. The permits are conditioned upon WSAFCA's receipt of permission from USACE for alteration of the Federal project works pursuant to Section 408.

7.2.2.7 California Surface Mining and Reclamation Act

The California Surface Mining and Reclamation Act of 1975 (PRC Section 2710 *et seq*.) (SMARA) addresses surface mining. Activities subject to SMARA include, but are not limited to, mining of minerals, gravel, and borrow material. The SMARA statute requires mitigation to reduce adverse impacts on public health, property, and the environment. Because SAFCA would require borrow material for project construction, SAFCA must comply with SMARA. SMARA applies to an individual or entity that would disturb more than 1 acre or remove more than 1,000 cubic yards of material through surface mining activities, including the excavation of borrow pits for soil material. SMARA is implemented through ordinances for permitting developed by local government "lead agencies" that provide the regulatory framework under which local mining and reclamation activities are conducted. The State Mining and Geology Board reviews the local ordinances to ensure that they meet the procedures established by SMARA.

The CHP Academy and The Rivers EIPs would use borrow from permitted sources; therefore, a SMARA permit would not be required. Other program activities may be subject to independent environmental review and SMARA compliance.

7.2.2.8 California Important Farmland Inventory System and Farmland Mapping and Monitoring Program

The California Department of Conservation, Office of Land Conservation, maintains a statewide inventory of farmlands. These lands are mapped by the Division of Land Resource Protection as part of the Farmland Mapping and Monitoring Program. The maps are updated every 2 years with the use of aerial photographs, a computer mapping system, public review, and field reconnaissance. Farmlands are divided into the following five categories based on their suitability for agriculture.

- Prime Farmland: land that has the best combination of physical and chemical characteristics for crop production. It has the soil quality, growing season, and moisture supply needed to produce sustained high yields of crops when treated and managed.
- Farmland of Statewide Importance: land other than Prime Farmland that has a good combination of physical and chemical characteristics for crop production.
- Unique Farmland: land that does not meet the criteria for Prime Farmland or Farmland of Statewide Importance, but that has been used for the production of specific crops with high economic value.
- Farmland of Local Importance: land that is either currently producing crops or has the capability of production, but that does not meet the criteria of the categories above.
- Grazing Land: land on which the vegetation is suited to the grazing of livestock.

These categories are sometimes referred to as Important Farmland. Other categories used in the mapping system are urban and built-up lands, lands committed to non-agricultural use, and other lands (land that does not meet the criteria of any of the other categories).

Prime Farmland and Farmland of Statewide Importance that occurs in the city of West Sacramento is concentrated in areas adjacent to the Sacramento River south levee and the South Cross levee (California Department of Conservation 2008). Farmland is discussed further in Section 3.11, Land Use and Agriculture. No farmland would be affected by the CHP Academy or The Rivers EIPs.

7.2.2.9 California Land Conservation Act (Williamson Act)

The California Land Conservation Act of 1965, commonly known as the Williamson Act (California Government Code Section 51200 *et seq*.), enables local governments to enter into contracts with private landowners for the purpose of promoting the continued use of the relevant land in agricultural or related open space use. In return, landowners receive property tax assessments that are based on farming and open space uses instead of full market value. Local governments receive an annual subvention (subsidy) of forgone property tax revenues from the state via the Open Space Subvention Act of 1971.

The Williamson Act empowers local governments to establish agricultural preserves consisting of lands devoted to agricultural uses and other compatible uses. Upon establishment of such preserves, the locality may offer to owners of included agricultural land the opportunity to enter into annually renewable contracts that restrict the land to agricultural use for at least 10 years (i.e., the contract continues to run for 10 years following the first date upon which the contract is not renewed). In return, the landowner is guaranteed a relatively stable tax rate, based on the value of the land for agricultural/open space use only and unaffected by its development potential.

As a public agency that may acquire lands within agricultural preserves, including lands under contract, SAFCA is exempt from the normal cancellation process for Williamson Act contracts, because the contract is nullified for the portion of the land actually acquired (California Government Code Section 51295). SAFCA must provide notice to the California Department of Conservation prior to acquiring such lands (California Government Code Section 51291[b]). A second notice is required within 10 working days after the land is actually acquired (California Government Code Section 51291 (c J). As the land would be acquired for flood damage reduction measures, SAFCA is exempt from the findings required in California Government Code Section 51292 (California Government Code Section 51293[e][1]) because the proposed project consists of flood control works. The preliminary notice to the California Department of Conservation, provided before lands are actually acquired, would demonstrate the purpose of the project and the exemption from the findings.

There are no Williamson Act contracts within the city limits.

7.2.2.10 California Fish and Game Code Section 3503 and 3503.5—Protection of Bird Nests and Raptors

Section 3503 of the California Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird. Section 3503.5 specifically states that it is unlawful to take, possess, or destroy any raptors (i.e., species in the orders *Falconiformes* and *Strigiformes*), including their nests or eggs. Typical violations of these codes include destruction of active nests resulting from removal of vegetation in which the nests are located. Violation of Section 3503.5 could also include failure of active raptor nests resulting from disturbance of nesting pairs by nearby

project construction. This statute does not provide for the issuance of any type of incidental take permit.

7.2.2.11 California Fish and Game Code—Fully Protected Species

Protection of fully protected species is described in Sections 3511, 4700, 5050, and 5515 of the California Fish and Game Code. These statutes prohibit take or possession of fully protected species and do not provide for authorization of incidental take of fully protected species. DFG has informed non-Federal agencies and private parties that their actions must avoid take of any fully protected species.

7.2.2.12 Basin Plan

Pursuant to the Porter-Cologne Act, the Central Valley RWQCB prepares and updates the Basin Plan for the Sacramento and San Joaquin River Basins every 3 years; the most recent update was completed in February 2007 (Central Valley Regional Water Quality Control Board 2007). The Basin Plan describes the officially designated beneficial uses for specific surface water and groundwater resources and the enforceable water quality objectives necessary to protect those beneficial uses. The Natomas Basin is located within the Central Valley RWQCB jurisdiction and is subject to the Basin Plan.

The Basin Plan includes numerical and narrative water quality objectives for physical and chemical water quality constituents. Numerical objectives are set for temperature, DO, turbidity, and pH; TDS, electrical conductivity, bacterial content, and various specific ions; trace metals; and synthetic organic compounds. Narrative objectives are set for parameters such as suspended solids, biostimulatory substances (e.g., nitrogen and phosphorus), oil and grease, color, taste, odor, and aquatic toxicity. Narrative objectives are often precursors to numeric objectives. The primary method used by the Central Valley RWQCB to ensure conformance with the Basin Plan's water quality objectives and implementation policies and procedures is to issue WDRs for projects that may discharge wastes to land or water. WDRs specify terms and conditions that must be followed during the implementation and operation of a project.

7.2.2.13 California Toxics Rule and State Implementation Policy

The CTR was promulgated in 2000 in response to requirements of the EPA NTR. The NTR and CTR criteria are regulatory criteria adopted for inland surface waters, enclosed bays, and estuaries in California that are subject to regulation pursuant to Section 303(c) of the CWA. The NTR and CTR include criteria for the protection of aquatic life and human health. Human health criteria (water and organisms) apply to all waters with a Municipal and Domestic Supply beneficial use designation as indicated in the RWQCBs' basin plans. The Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, also known as the State Implementation Plan, was adopted by the State Water Board in 2000 to establish provisions for translating CTR criteria, NTR criteria, and basin plan water quality objectives for toxic pollutants into the following:

- NPDES permit effluent limits,
- compliance determinations,
- monitoring for dioxin (2,3,7,8-TCDD) equivalents,

- chronic toxicity control provisions,
- initiating site-specific objective development, and
- granting exceptions.

See Section 3.3, Water Quality and Groundwater Resources, for program-related information and Chapters 4 and 5 for EIP information.

7.2.2.14 California Register of Historic Resources

The CRHR includes resources that are listed in or formally determined eligible for listing in the NRHP (see Section 3.18, Cultural Resources) as well as some California State Landmarks and Points of Historical Interest (PRC Section 5024.1, 14, CCR Section 4850). Properties of local significance that have been designated under a local preservation ordinance (local landmarks or landmark districts) or that have been identified in a local historical resources inventory may be eligible for listing in the CRHR and are presumed to be significant resources for purposes of CEQA unless a preponderance of evidence indicates otherwise (State CEQA Guidelines Section 15064.5[a][2]). The eligibility criteria for listing in the CRHR are similar to those for NRHP listing but focus on the importance of the resources to California history and heritage. A cultural resource may be eligible for listing in the CRHR if it:

1. is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. is associated with the lives of person important in our past;
3. embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important individual, or possesses high artistic values; or
4. has yielded, or may be likely to yield, information important in prehistory or history.

7.2.2.15 Native American Heritage Commission

NAHC identifies and catalogs places of special religious or social significance to Native Americans and known graves and cemeteries of Native Americans on private lands, and performs other duties regarding the preservation and accessibility of sacred sites and burials and the disposition of Native American human remains and burial items. Consultation with NAHC and the Sacred Lands database was negative for findings in the WSLIP area, which is discussed in Section 3.18, Cultural Resources.

7.2.2.16 California Climate Solutions Act

In September 2006, Governor Arnold Schwarzenegger signed AB 32, the California Climate Solutions Act of 2006. AB 32 requires that statewide GHG emissions be reduced to 1990 levels by 2020. This reduction will be accomplished through an enforceable statewide cap on GHG emissions that will be phased in starting in 2012. To effectively implement the cap, AB 32 directs CARB to develop and implement regulations to reduce statewide GHG emissions from stationary sources. AB 32 specifies that regulations adopted in response to AB 1493 should be used to address GHG emissions from vehicles. However, AB 32 also includes language stating that if the AB 1493 regulations cannot be implemented, then CARB should develop new regulations to control vehicle GHG emissions under the authorization of AB 32.

AB 32 requires that CARB adopt a quantified cap on GHG emissions representing 1990 emissions levels and disclose how it arrives at the cap; institute a schedule to meet the emissions cap; and develop tracking, reporting, and enforcement mechanisms to ensure that the state achieves the reductions in GHG emissions necessary to meet the cap. AB 32 also includes guidance to institute emissions reductions in an economically efficient manner and conditions to ensure that businesses and consumers are not unfairly affected by the reductions.

Contributions of GHG emissions related to the program are discussed in Section 3.6, Air Quality and Climate Change. Chapters 4 and 5 provide EIP-specific information.

7.2.2.17 State of California General Plan Guidelines

The OPR published the *State of California General Plan Guidelines* (Governor's Office of Planning and Research 2003), which provides guidance for the acceptability of projects within specific L_{dn} contours. Generally, residential uses (e.g., mobile homes) are considered to be acceptable in areas where exterior noise levels do not exceed 60 dBA L_{dn}. Residential uses are normally unacceptable in areas exceeding 70 dBA L_{dn} and conditionally acceptable within 55–70 dBA L_{dn}.

Schools are normally acceptable in areas up to 70 dBA Ldn and normally unacceptable in areas exceeding 70 dBA L_{dn}. Commercial uses are normally acceptable in areas with a CNEL of up to 70 dBA. Commercial uses are conditionally acceptable where the Ldn is between 67.5 and 77.5 dBA, depending on the noise insulation features and the noise reduction requirements. The guidelines also provide adjustment factors for determining noise acceptability standards that reflect the noise control goals of the community, the particular community's sensitivity to noise, and the community's assessment of the relative importance of noise pollution.

Noise studies and program-related impacts and mitigation are discussed in Section 3.7, Noise. Chapters 4 and 5 provide EIP-specific information.

7.2.2.18 California Code of Regulations, Title 24

Title 24 of CCR establishes standards governing interior noise levels that apply to all new multi-family residential units in California. These standards require that acoustical studies be performed before construction begins at locations where the existing L_{dn} exceeds 60 dBA. Such acoustical studies are required to establish mitigation measures that limit maximum L_{dn} levels to 45 dBA in any habitable room. Although no generally applicable interior noise standards are pertinent to all uses, many communities in California have adopted an L_{dn} of 45 dBA as an upper limit on interior noise in all residential units.

Noise studies and program-related impacts and mitigation are discussed in Section 3.7, Noise. Chapters 4 and 5 provide EIP-specific information.

7.2.2.19 Central Valley Flood Control Act of 2008

The Central Valley Flood Control Act of 2008, passed in 2007, recognizes that the Central Valley of California, which includes the City of West Sacramento, is experiencing unprecedented development, resulting in the conversion of historically agricultural lands and communities to densely populated residential and urban centers. Because of the potentially catastrophic consequences of flooding, the Act recognizes that the Federal government's current 100-year flood protection standard is not sufficient to protect urban and urbanizing areas within flood-prone areas throughout the Central

Valley and declares that the minimum standard for these areas is a 200-year level of flood protection. To continue with urban development, cities and counties must develop and implement plans for achieving this new standard by 2025. With respect to flood risk reduction, the Central Valley Flood Control Act also calls upon DWR to develop a comprehensive CVPP by the end of 2012 for protecting the lands currently within the Sacramento–San Joaquin River Flood Management System.

7.2.2.20 California Regulations for Environmental Justice

Most state governments have plans and policies intended to protect and expand the local and regional economies affecting the communities within their jurisdictions. State plans and policies also frequently address other social and economic impact topics, including fiscal conditions and related public services that affect local residents' quality of life.

Within California, SB 115 (Chapter 690, Statutes of 1999) was signed into law in 1999. The legislation established OPR as the coordinating agency for state environmental justice programs (California Government Code, Section 65040.12[a]) and defined environmental justice in statute as "the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies" (Government Code Section 65040.12(e). SB 115 further required the CalEPA to develop a model environmental justice mission statement for boards, departments, and offices within the agency by January 1, 2001 (Public Resources Code, Sections 72000–72001).

In 2000, SB 89 (Chapter 728, Statutes of 2000) was signed, which complemented SB 115 by requiring the creation of an environmental justice working group and an advisory group to assist CalEPA in developing an intra-agency environmental justice strategy (PRC Sections 72002–72003). SB 828 (Chapter 765, Statutes of 2001) added and modified due dates for the development of CalEPA's intra-agency environmental justice strategy and required each board, department, and office within CalEPA to identify and address, no later than January 1,2004, any gaps in its existing programs, policies, and activities that may impede environmental justice (PRC, Sections 71114–71115).

Cal/EP A adopted its environmental justice policy in 2004 (California PRC, Sections 71110–71113). This policy (or strategy) provides guidance to its resource boards, departments, and offices. It is intended to help achieve the state's goal of "achieving fair treatment of people of all races, cultures and incomes with respect to the development, adoption, implementation and enforcement of environmental laws and policies."

AB 1553 (Chapter 762, Statutes of 2001) required OPR to incorporate environmental justice considerations in the General Plan Guidelines. AB 1553 specified that the guidelines should propose methods for local governments to address the following:

- planning for the equitable distribution of new public facilities and services that increase and enhance community quality of life,
- providing for the location of industrial facilities and uses that pose a significant hazard to human health and safety in a manner that seeks to avoid over-concentrating these uses in proximity to schools or residential dwellings,

- providing for the location of new schools and residential dwellings in a manner that avoids proximity to industrial facilities and uses that pose a significant hazard to human health and safety, and
- promoting more livable communities by expanding opportunities for transit-oriented development.

Although environmental justice is not a mandatory topic in the general plan, OPR is required to provide guidance to cities and counties for integrating environmental justice into their general plans. The 2003 edition of the *General Plan Guidelines* included the contents required by AB 1553 (see pages 8, 12, 20–27, 40, 114, 142, 144, and 260 of the revised *General Plan Guidelines*).

Environmental justice issues pertaining to the WSLIP are discussed in Section 3.13, Environmental Justice.

7.2.2.21 Water Use Efficiency

The California Constitution prohibits the waste or unreasonable use of water. Further, Water Code Section 275 directs DWR and the State Water Board to "take all appropriate proceedings or actions before executive, legislative, or judicial agencies to prevent waste or unreasonable use of water." Several legislative acts have been adopted to develop efficient use of water in the state:

- Urban Water Management Planning Act of 1985,
- Water Conservation in Landscaping Act of 1992,
- Agricultural Water Management Planning Act,
- Agricultural Water Suppliers Efficient Management Practices Act of 1990,
- Water Recycling Act of 1991, and
- Agricultural Water Conservation and Management Act of 1992.

The purpose of the WSLIP is to address flood issues; it would not result in the waste or unreasonable use of water.

7.2.2.22 Public Trust Doctrine

When planning and allocating water resources, the State of California is required to consider the public trust and preserve for the public interest the uses protected by the trust. The public trust doctrine embodies the principle that certain resources, including water, belong to all and, thus, are held in trust by the state for future generations.

In common law, the public trust doctrine protects navigation, commerce, and fisheries uses in navigable waterways. However, the courts have expanded the doctrine's application to include protecting tideland, wildlife, recreation, and other public trust resources in their natural state for recreational, ecological, and habitat purposes as they affect birds and marine life in navigable waters. *The National Audubon Society v. Superior Court of Alpine County* (1983) 33 Cal 3d 419 decision extended the public trust doctrine's limitations on private rights to appropriative water rights, and also ruled that longstanding water rights could be subject to reconsideration and could possibly be curtailed. The doctrine, however, generally requires the court and the State Water Board to perform a balancing test to weigh the potential value to society of a proposed or existing diversion against its impact on trust resources.

The 1986 Rancanelli decision applied the public trust doctrine to decisions by the State Water Board and held that this doctrine must be applied by the State Water Board in balancing all the competing interests in the uses of Bay-Delta waters (*United States v. State Water Resources Control Board* [1986] 182 Cal. App. 3d 82).

The WSLIP is consistent with the public trust doctrine, as its primary goals include improved flood control.

7.2.2.23 Davis-Dolwig Act

The Davis-Dolwig Act declares that recreation and fish and wildlife enhancement are among the purposes of state water projects. It specifies that costs for recreation and fish and wildlife enhancement not be included in prices, rates, and charges for water and power to urban and agricultural users. Under the Davis-Dolwig Act, land for recreation and fish and wildlife enhancement must be planned and initiated at the same time as any other land acquisition for the project. Implementation of the Program would include the construction of recreation facilities such as wildlife viewing areas, trails, boat ramps, and a promenade. Therefore, the WSLIP would be consistent with this act.

7.2.2.24 Relocation Assistance and Property Acquisition

The State of California's Government Code Section 7260, *et seq.* brings the California Relocation Act into conformity with the Federal Uniform Act. In the acquisition of real property by a public agency, both the Federal and state acts seek to (1) ensure consistent and fair treatment of owners of real property, (2) encourage and expedite acquisition by agreement to avoid litigation and relieve congestion in the courts, and (3) promote confidence in public land acquisition.

The Relocation Assistance and Real Property Acquisition Guidelines were established by 25 CCR 1.6. The guidelines were developed to assist public entities with developing regulations and procedures implementing Title 42, Chapter 61 of the USC, the Uniform Act, for Federal and Federally-assisted programs. The guidelines are designed to ensure that uniform, fair, and equitable treatment is given to people displaced from their homes, businesses, or farms as a result of the actions of a public entity. Under the act, persons required to relocate temporarily are not considered displaced, but must be treated fairly. Such persons have a right to temporary housing that is decent, safe, and sanitary, and must be reimbursed for all reasonable out-of-pocket expenses. In accordance with these guidelines, people may not suffer disproportionate injury as a result of action taken for the benefit of the public as a whole. Additionally, public entities must ensure consistent and fair treatment of owners of such property, and encourage and expedite acquisitions by agreement with owners of displaced property to avoid litigation.

Property acquisition and relocation services, compensation for living expenses for temporarily relocated residents, and negotiations regarding any compensation for temporary loss of business would be accomplished in accordance with the Uniform Act (see above) and California Government Code Section 7267 *et seq*.

7.2.3 State and Regional Plan Consistency

7.2.3.1 Clean Water Act, Section 303(d)

Under CWA Section 303(d), the RWQCB and the State Water Board list water bodies as impaired when not in compliance with designated water quality objectives and standards. A TMDL program must be prepared for waters identified by the state as impaired. A TMDL is a quantitative assessment of a problem that affects water quality. The problem can include the presence of a pollutant, such as a heavy metal or a pesticide, or a change in the physical property of the water, such as DO or temperature. A TMDL specifies the allowable load of pollutants from individual sources to ensure compliance with water quality standards. Once the allowable load and existing source loads have been determined, reductions in allowable loads are allocated to individual pollutant sources.

The WSLIP would have no effect on TMDL issues for the Sacramento River.

7.2.3.2 Water Rights

The State of California recognizes riparian and appropriative surface water rights. Riparian rights are correlative entitlements to water that are held by owners of land bordering natural watercourses. California requires a statement of diversion and use of natural flows on adjacent riparian land under a riparian right. Appropriative water rights allow the diversion of a specified amount of water from a source for reasonable and beneficial use during all or a portion of the year. In California, previously issued appropriative water rights are superior to and take precedence over newly granted rights. The State Water Board has authority to issue permits to grant appropriative water rights. The WSLIP is consistent with current water rights.

7.2.4 Local Plan Consistency and Regulatory Requirements

In addition to the Federal and state regulatory and local plan requirements, the project may be subject to certain zoning or other ordinances and general plans of Yolo County and the City of West Sacramento. For more discussion on local plans and requirements applicable to the project, refer to the Regulatory Setting part of the specific resource sections of interest within this document.

Sacramento County Airport System. 2007. *Wildlife Hazard Management Plan*. March 7. Available: <http://www.sacairports.org/int/about/environment/environment.html>.

Chapter 9
List of Preparers

This EIS/EIR was prepared by ICF International at the direction of USACE, with participation from WSAFCA as the applicant and CEQA lead agency. The following individuals participated in the preparation of this EIS/EIR.

9.1 U.S. Army Corps of Engineers

Name	Education/Experience	Responsibility
John Suazo	B.A. Environmental Studies; 17 years experience	USACE Project Manager (environmental)
Claire Marie Turner	B.S. Marine Biology; 3 years experience	Section 408 Project Manager
Lisa Clay	J.D.; 22 years experience	Legal Review

9.2 West Sacramento Area Flood Control Agency

Name	Education/Experience	Responsibility
John Powderly	B.S. Electrical Engineering; 6 years experience	Environmental Project Manager/City of West Sacramento Associate Planner
Michael Bessette	B.S. Civil Engineering; 19 years experience	Flood Program Manager, City of West Sacramento
Dave Shpak	B.S. Environmental Policy Analysis and Planning; 22 years experience	Park Development Manager, City of West Sacramento
Ken Jameson	B.A. Anthropology/Geology, Licensed Professional Geologist; 12 years experience	Engineering Assistant, City of West Sacramento
Ken Ruzich	B.S. Civil Engineering; 30 years experience	General Manager, WSAFCA, Reclamation District 900

9.3 ICF International

Name	Education/Experience	Responsibility
Christopher Elliott	B.S. Landscape Architecture; 15 years experience	Project Director
Tanya D. Matson	B.A. Environmental Studies; 10 years experience	Project Manager
Laurel Armer	B.S. Environmental Horticulture and Urban Forestry; 7 years experience	Project Manager
Jennifer Rogers	B.A Journalism; 6 years experience	Project Coordinator
Sara Martin	B.A. Anthropology & German; 8 years experience	Environmental Resource Analyst
Carol-Anne Hicks	B.S. Environmental & Resource Sciences; 7 years experience	Publications Specialist
Kate Walsh	B.A. Art History & Photography; 8 years experience	Publications Specialist
Laura Cooper	B.A. Psychology; 20 years experience	Editor
Darle Tilly	B.A. English Literature; 25+ years experience	Editor
Andrew Humphrey	B.A. History; 1 year experience	Environmental Resource Analyst
Lesa Erecius	B.S. Physiology, M.S. Pharmacology & Toxicology (aquatic toxicology focus); 3.5 years of experience	Environmental Resource Analyst
Julia Hooten	B.A. Geography (concentration in Biology/Physical Environment); 1 year experience	Environmental Resource Analyst
Joshua Carman	B.A. Environmental Studies; 5 years experience	Noise Analyst
Jim Wilder	B.S Civil Engineering, M.S. Environmental Engineering; 32 years experience	Air Quality and Climate Change and Noise
Kai-Ling Kuo	B.S. Civil Engineering, M.S. Civil & Environmental Engineering; 6 years experience	Air Quality and Climate Change
Kristin Teddy	B.S. Landscape Architecture; 3 years experience	Visual Resources
Jeff Peters	B.A. Geology, M.S. Geography; 7 years experience	Geology, Seismicity, Soils, and Mineral Resources
Nate Martin	B.A. Environmental Studies, M.S. Public Policy; 9 years experience	Water Quality and Groundwater Resources
Andrea Mauro	B.S. Geography (emphasis on soil science); 3 years experience	Geology, Seismicity, Soils, and Mineral Resources
Jennifer Stock	BLA Landscape Architecture; 10 years experience	Visual Resources
Jessica Hughes	B.S. Biology, M.S. Botany & Plant Pathology; 4 years experience	Vegetation and Wetlands
Brad Schafer	B.S. Biology; 12 years experience	Vegetation and Wetlands
Erin Hitchcock	B.S. Wildlife, Fisheries, and Conservation Biology; 7 years experience	Wildlife
Gabriel Roark	B.A. Anthropology; 10 years experience	Cultural Resources
Madeline Bowen	B.A. Liberal Studies/Social Science, M.S. History; 13 years experience	Cultural Resources
Traci O'Brien	B.A. Anthropology; 22 years experience	Cultural Resources
Trish Fernandez	B.A. Anthropology, M.S. Anthropology; 14 years experience	Cultural Resources

Name	Education/Experience	Responsibility
Donna Maniscalco	B.S. Wildlife, Fish, and Conservation Biology; 8.5 years experience	Fisheries and Aquatics
Bill Mitchell	M.S. Fisheries Biology; 24+ years experience	Fisheries and Aquatics
Becky Crosswhite	B.S. Community & Regional Development; 9 years experience	GIS technician
Alan Barnard	Graphic & Web Designer;13 years experience	Graphic designer
John Durnan	B.S. Biochemistry, Web site Design; 6 years experience	Graphic designer
Sacha Selim	B.A. Business Management Economics; 8 years experience	GIS technician

9.4 Other Contributors

Name	Education/Experience	Responsibility
Ric Reinhardt, P.E.(MBK Engineers	M.S. Civil Engineering, B.S. Civil Engineering; 15 years experience	Program Manager (consultant to WSAFCA)
Derek Larsen, P.E. (MBK Engineers)	Master of Business Administration, B.S. Environmental Engineering; 14 years experience	Program Coordinator (consultant to WSAFCA)
Ben Tustison, P.E. (MBK Engineers)	M.S. Civil Engineering, B.S. Geological Engineering; 11 years experience	Hydraulic Analyst (consultant to WSAFCA)
Eric Nagy, P.E. (HDR)	B.S. Civil Engineering; 12 years experience	Engineering Project Manager (consultant to WSAFCA)
Michael Vecchio, P.E. (HDR)	M.S. Civil Engineering, B.S. Geological Sciences, B.A. English; 13 years experience	Engineering Lead Designer (consultant to WSAFCA)

Chapter 10
List of Recipients

The following elected official and representatives, Federal, state, local agencies, private organizations, businesses, and residents of the City of West Sacramento would either receive a copy of the draft EIS/EIR or a notification of document availability. Individuals who may be affected by the project or have expressed interest through the public involvement process would also be notified.

10.1 Elected Officials and Representatives

- Alyson Huber, Assemblymember, 10th Assembly District
- Barbara Boxer, Senator, United States Senate
- Barbara Kondylis, Supervisor, Solano County—District 1
- Bill Berryhill, Assemblyman, 26th Assembly District
- Darrell Steinberg, State Senator, 6th Senate District
- Dianne Feinstein, Senator, United States Senate
- Don Nottoli, Supervisor, Sacramento County—District 5
- Doris Matsui, U.S. Congresswoman, 5th Congressional District
- Duane Chamberlain, Supervisor, Yolo County—District 5
- Helen Thomson, Supervisor, Yolo County—District 2
- James P. Spering, Supervisor, Solano County—District 3
- Jim Provenza, Supervisor, Yolo County—District 4
- Jimmie Yee, Supervisor, Sacramento County—District 2
- Joan Buchanan, Assemblymember, 15th Assembly District
- John Garamendi, U.S. Congressman, 10th Congressional District
- John M. Vasquez, Supervisor, Solano County—District 4
- Linda J. Seifert, Supervisor, Solano County—District 2
- Lois Wolk, State Senator, 5th Senate District
- Marika Yamada, Assemblymember, 8th Assembly District
- Matt Rexroad, Supervisor, Yolo County—District 3
- Michael J. Reagan, Supervisor, Solano County—District 5
- Mike McGowan, Supervisor, Yolo County—District 1
- Mike Thompson, U.S. Congressman, 1st Congressional District
- Roberta MacGlashan, Supervisor, Sacramento County—District 4
- Roger Dickinson, Supervisor, Sacramento County—District 1
- Susan Peters, Supervisor, Sacramento County—District 3

10.2 Government Department and Agencies

10.2.1 U.S. Government

- Federal Emergency Management Agency
- National Marine Fisheries Service
- Native American Heritage Commission
- U.S. Army Corps of Engineers, Sacramento District Environmental Analysis Section
- U.S. Bureau of Reclamation - Mid-Pacific Region
- U.S. Environmental Protection Agency, Region 9
- U.S. Fish and Wildlife Service, Sacramento Fish and Wildlife Office
- United States Coast Guard, District 11
- USDA Natural Resources Conservation Service

10.2.2 State of California

- California Department of Boating and Waterways
- California Department of Conservation
- California Department of Fish and Game
- California Department of Parks and Recreation
- California Department of Transportation - District 3
- California Department of Water Resources
- California Highway Patrol Academy
- California Public Utilities Commission
- California State Lands Commission
- Central Valley Flood Protection Board
- Central Valley Regional Water Quality Control Board
- Delta Protection Commission
- Office of Historic Preservation
- Reclamation District 537
- Reclamation District 811
- Sacramento Metropolitan Air Quality Management District
- State Clearinghouse, Office of Planning & Research
- State Water Resources Control Board, Division of Water Rights
- West Sacramento Area Flood Control Agency
- Yolo-Solano Air Quality Management District

10.2.3 Regional, County and City

- City of Sacramento
- City of West Sacramento
- Contra Costa County
- Napa County Planning Commission
- Sacramento Area Flood Control Agency
- Sacramento County Planning and Community Development
- Sacramento County Regional Sanitation District
- Sacramento Public Library
- Solano County
- Solano County Library
- Sutter County Planning Division
- Washington Unified School District
- Yolo County Agricultural Commissioner
- Yolo County Environmental Health Department
- Yolo County Library
- Yolo County Planning Department
- Yolo County Transit District

10.3 Private Organizations, Businesses, and Residents

- Bill Falik
- Brown and Caldwell
- Cheryl and Bobby Cobbs
- Cindy Kawano
- Cliff Jones
- Dan Ramos
- David Doomey
- Downey Brand
- Friends of the Swainson's Hawk
- HDR Engineering
- Helen Smith
- James Bruchill & Associates
- Jeffrey Twitchell
- JF Schneider

- Joe Goeden
- John Ohslan
- Kiewit Pacific
- Laren Brandon
- MBK Engineers
- Pat Flint
- Port of West Sacramento
- Residents surrounding the CHP EIP and Rivers EIP Project sites
- Rodney Watson
- Save our City
- Sierra Holdings LLC
- Sierra Northern Railway
- The Grupe Company
- The Pacific Gas and Electric Company
- Trevor Burwell
- West Sacramento Historical Society
- Wildlands

California Fish and Game Code, 3.8-3, 3.8-4, 3.9-4, 3.10-3, 3.10-13, 3.10-21, 3.10-24, 3.10-27, 3.10-38, 4-105, 4-110, 4-122, 4-135, 4-137, 4-84, 5-92, 5-107, 5-113, 5-124, 5-135, 5-136, 5-137, 7-12, 7-14, 7-15

California Indian Heritage Center, 2-39, 3.15-3, 6-14

California Native Plan Protection Act, 3.8-3, 3.8-14

California Public Utilities Commission, 3.16-1, 3.16-4, 4-161, 5-167

California Register of Historic Resources, 3.18-3, 3.18-5, 3.18-13, 3.18-15, 3.18-16, 3.18-17, 3.18-18, 4-178, 4-179, 4-181, 4-182, 5-185, 5-186, 5-187, 5-188, 5-189, 7-16

carbon dioxide, 3.6-8, 3.6-9, 3.6-17, 3.6-19, 3.6-28, 3.6-30, 3.6-31, 3.6-32, 4-60, 4-64, 4-71, 4-73, 4-74, 4-76

carbon monoxide, 3.2-41, 3.3-6, 3.3-7, 3.6-2, 3.6-3, 3.6-4, 3.6-6, 3.6-7, 3.6-9, 3.6-12, 3.6-14, 3.6-15, 3.6-16, 3.6-22, 3.6-24, 4-27, 4-58, 4-59, 4-63, 4-64, 4-65, 4-67, 4-70, 4-71, 5-26

Central Park, 3.9-34, 3.9-36, 3.9-38

Central Valley Flood Protection Board, 1-15, 1-18, 1-20, 1-23, 1-26, 1-27, 1-29, 2-33, 2-35, 2-37, 2-38, 3.2-5, 3.2-9, 3.16-5, 4-11, 4-15, 4-17, 4-18, 4-20, 5-7, 5-10, 5-12, 5-13, 5-14, 5-18, 5-170, 5-172, 6-6, 7-13

Central Valley Flood Protection Plan, 1-15, 1-18, 1-24, 3.2-7, 3.2-8, 3.17-4, 3.17-5

Central Valley spring-run Chinook, 3.9-2, 3.9-10, 3.9-11, 3.9-13, 3.9-14, 3.9-15, 3.9-17, 3.9-18, 3.9-20, 3.9-25

Central Valley steelhead, 3.9-2, 3.9-6, 3.9-7, 3.9-8, 3.9-9, 3.9-10, 3.9-11, 3.9-15, 3.9-17, 3.9-19, 3.9-20, 3.9-21, 3.9-22, 3.9-23, 3.9-25, 3.9-26, 3.9-28, 3.9-32, 3.9-37, 3.9-38, 3.18-8, 4-106, 5-108, 5-111

CEQA Guidelines, 1-3, 1-4, 1-5, 1-6, 1-7, 1-29, 3.2-1, 3.2-59, 3.3-12, 3.4-14, 3.5-13, 3.6-10, 3.6-20, 3.6-29, 3.7-11, 3.8-14, 3.8-21, 3.9-24, 3.10-13, 3.10-30, 3.11-8, 3.12-9, 3.14-19, 3.15-13, 3.16-7, 3.17-7, 3.18-7, 4-27, 4-33, 4-42, 4-51, 4-61, 4-74, 4-96, 4-107, 4-126, 4-139, 4-143, 4-153, 4-157, 4-163, 4-169, 4-170, 5-27, 5-33, 5-43, 5-53, 5-97, 5-108, 5-128, 5-140, 5-145, 5-156, 5-162, 5-169, 5-176, 6-1, 6-9, 7-11, 7-16

channel morphology, 3.2-14, 3.2-16, 3.2-21

Clean Air Act, 3.6-1, 3.6-2, 3.6-3, 3.6-4, 3.6-5, 3.6-8, 4-57, 6-3, 7-8

Clean Water Act, 1-1, 1-4, 3.2-5, 3.3-1, 3.3-2, 3.3-3, 3.3-4, 3.3-5, 3.3-8, 3.8-2, 3.8-4, 3.8-10, 3.8-12, 3.8-21, 3.8-22, 3.9-2, 3.9-3, 3.9-4, 4-20, 4-32, 4-84, 4-89, 4-96, 4-97, 4-101, 4-104, 4-105, 5-18, 5-32, 5-91, 5-98, 5-103, 5-106, 5-107, 6-3, 6-4, 7-2, 7-3, 7-4, 7-5, 7-12, 7-15, 7-21

closure structure, 2-5, 2-11, 2-15, 2-16, 2-40, 3.2-4, 3.2-61, 3.2-62, 3.2-65, 3.3-14, 3.3-16, 3.3-18, 3.4-17, 3.4-18, 3.4-19, 3.5-14, 3.5-15, 3.5-16, 3.5-17, 3.5-19, 3.6-21, 3.6-23, 3.6-26, 3.6-27, 3.6-28, 3.6-31, 3.6-33, 3.6-34, 3.7-20, 3.7-21, 3.7-24, 3.7-26, 3.7-28, 3.8-24, 3.8-26, 3.8-29, 3.8-30, 3.8-31, 3.8-33, 3.9-27, 3.9-28, 3.9-30, 3.9-31, 3.9-32, 3.9-39, 3.10-33, 3.10-34, 3.10-38, 3.10-40, 3.11-10, 3.12-12, 3.12-15, 3.12-16, 3.12-17, 3.13-5, 3.14-22, 3.14-23, 3.14-24, 3.14-25, 3.14-26, 3.15-15, 3.15-20, 3.15-22, 3.15-23

community noise equivalent level, 3.7-2, 3.7-3, 3.7-8, 7-17

delta smelt, 3.9-2, 3.9-6, 3.9-7, 3.9-9, 3.9-10, 3.9-11, 3.9-16, 3.9-18, 3.9-19, 3.9-20, 3.9-21, 3.9-22, 3.9-23, 3.9-39, 4-108, 5-108

depressional wetland(s), 4-10, 4-86, 4-87, 4-88, 4-89, 4-101, 4-104, 4-112, 4-113, 4-123, 4-130, 4-132, 4-133

dewatering, 3.3-3, 3.3-17, 3.3-18, 3.8-22, 3.17-11, 4-35, 4-37, 4-38, 4-39, 4-97, 4-171, 4-172, 4-174, 4-175, 5-35, 5-37, 5-39, 5-99, 5-177, 5-178, 5-180, 5-181

dissolved oxygen, 3.3-4, 3.3-5, 3.3-8, 3.3-9, 3.3-10, 3.9-19, 3.9-20, 4-33, 5-33, 7-15, 7-21

drainage ditch, 3.3-2, 3.3-15, 3.3-16, 4-14, 4-16, 4-83, 4-87, 4-88, 4-89, 4-101, 4-104, 4-112, 4-114, 4-123, 4-167, 5-111

elderberry shrub(s), 3.8-11, 3.8-28, 3.10-14, 3.10-22, 3.10-32, 3.10-37, 4-8, 4-9, 4-10, 4-15, 4-85, 4-88, 4-89, 4-100, 4-101, 4-111, 4-112, 4-115, 4-123, 4-129, 4-130, 5-9, 5-15, 5-92, 5-94, 5-98, 5-102, 5-114, 5-115, 5-116, 5-118, 5-125, 5-130, 5-131, 5-132

employment, 2-8, 3.6-21, 3.12-1, 3.12-3, 3.12-4, 3.12-5, 3.12-6, 3.12-7, 3.12-9, 3.12-10, 3.12-11, 3.12-13, 3.12-14, 3.12-15, 3.13-3, 4-7, 4-

65, 4-143, 4-144, 4-145, 4-147, 5-6, 5-145, 5-146, 5-147, 5-148, 5-150, 6-7

Endangered Species Act, federal, 3.3-2, 3.8-1, 3.8-2, 3.8-3, 3.8-14, 3.8-20, 3.9-1, 3.9-2, 3.9-4, 3.9-12, 3.9-13, 3.9-15, 3.9-16, 3.9-24, 3.9-37, 3.10-1, 3.10-2, 3.10-13, 3.10-21, 3.10-22, 3.10-37, 4-10, 4-84, 4-89, 4-94, 4-105, 4-107, 4-110, 4-114, 4-122, 4-128, 4-130, 4-133, 4-136, 5-9, 5-91, 5-95, 5-107, 5-108, 5-113, 5-117, 5-124, 5-129, 5-130, 5-132, 5-135, 5-136, 6-3, 6-4, 7-1, 7-2, 7-5, 7-10, 7-11

environmental commitment(s), 2-1, 2-42, 2-43, 2-49, 3.3-13, 3.3-14, 3.3-15, 3.3-16, 3.3-17, 3.4-18, 3.4-19, 3.5-14, 3.5-15, 3.5-16, 3.5-17, 3.5-18, 3.5-19, 3.5-21, 3.7-23, 3.7-26, 3.8-33, 3.9-30, 3.9-31, 3.9-35, 3.12-14, 3.14-22, 3.14-24, 3.14-25, 3.15-16, 3.15-17, 3.15-18, 3.15-19, 3.15-20, 3.15-21, 3.15-25, 3.15-27, 3.15-28, 3.15-29, 3.15-30, 3.17-9, 3.17-10, 3.17-12, 4-18, 4-35, 4-36, 4-37, 4-38, 4-39, 4-45, 4-53, 4-54, 4-102, 4-154, 4-155, 4-158, 4-159, 4-171, 4-172, 4-173, 4-174, 4-175, 5-17, 5-35, 5-36, 5-37, 5-38, 5-46, 5-55, 5-56, 5-58, 5-59, 5-85, 5-88, 5-104, 5-106, 5-110, 5-111, 5-112, 5-157, 5-158, 5-159, 5-160, 5-163, 5-164, 5-165, 5-166, 5-171, 5-172, 5-177, 5-178, 5-179, 5-181, 6-4, 6-19, 6-22

erosion mechanisms, 3.2-21, 3.2-27, 3.2-28

Executive Order 11988, 3.2-5, 4-20, 5-18, 6-1, 6-4, 7-7

Executive Order 11990, 3.8-3, 4-84, 5-91, 7-7

Executive Order 12898, 3.13-1, 4-146, 5-149, 7-7

Executive Order 13112, 3.8-3, 4-84, 5-91

farmland designations, 3.11-1, 4-138, 5-139

Farmland Protection Policy Act, 3.11-1, 4-138, 5-139, 7-5

Federal Emergency Management Agency, 1-14, 1-15, 1-17, 1-18, 1-25, 2-6, 2-9, 3.2-2, 3.2-3, 3.2-7, 3.2-8, 3.2-16, 3.2-19, 3.2-35, 3.2-36, 3.2-37, 3.2-39, 3.2-40, 3.2-41, 3.12-11, 3.12-16, 3.16-4, 3.17-3, 3.17-12, 4-26, 4-173, 4-175, 5-25, 5-26, 5-179, 5-182, 6-5, 6-7, 6-8

flood elevation(s), 3.2-37, 3.2-41, 4-26, 5-26

Scoping Report

ICF Jones & Stokes
an ICF International Company

Memorandum

Date:	March 27, 2009
To:	John Powderly, City of West Sacramento, Ken Ruzich, WSAFCA
cc:	Chris Elliott, ICF Jones & Stokes, Tanya Matson, ICF Jones & Stokes, Laurel Armer, ICF Jones & Stokes
From:	Jennifer Rogers, ICF Jones& Stokes
Subject:	**Public Meeting Summary for West Sacramento Levee Improvements Program EIS/EIR—February 2009**

Introduction

The West Sacramento Area Flood Control Agency (WSAFCA) is proposing the West Sacramento Levee Improvements Program (WSLIP) to improve the levees in Yolo and Solano Counties that protect the city of West Sacramento.

To protect human health and safety and prevent adverse effects on property and its economy, the City of West Sacramento (City), as part of WSAFCA, and in partnership with the California Department of Water Resources (DWR), embarked on a comprehensive evaluation of the condition of the levees protecting the city in 2006. The results of the comprehensive evaluation revealed several deficiencies that require substantial improvements.

The purpose and objective of the WSLIP is:

- achieve a minimum of a 200-year level of flood protection for the entire city by improving the approximately 50 miles of levees that protect it;
- construct levee improvements as soon as possible to reduce flood risk as quickly as possible;
- construct improvements that are politically, socially and environmentally acceptable; and
- provide recreational and open space elements for the city that are compatible with flood improvement actions.

To comply with the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA), WSAFCA and the USACE, respectively, are preparing a joint Environmental Impact Statement/Environmental Impact Report (EIS/EIR) to analyze and disclose the potential effects the WSLIP may have on the natural and human environment and identify mitigation measures and alternatives to avoid significant effects. WSAFCA is the project lead agency for the purposes of the California Environmental Quality Act and USACE is the project lead agency for the purposes of National Environmental Policy Act (NEPA).

The City and USACE have been carrying out scoping activities to assist them in determining the scope, focus and content of the EIS/EIR. The City and USACE have had ongoing inter-agency consultation with responsible and interested agencies such as the United States Fish and Wildlife Service, National Marine Fisheries Service, and the California Department of Fish and Game, to name a few. In addition, the City and USACE conducted two public scoping meetings for the public and for federal and state agency staff on February 12, 2009. The following summarizes the outreach conducted to inform responsible and interested agencies and the public of the proposed WSLIP, the scoping meetings, and the public comment received.

Noticing

Notice of Intent/Preparation

In compliance with the requirements set forth in CEQA, WSAFCA prepared a Notice of Preparation (NOP). The NOP contained a brief description of the proposed project, project date, probable environmental effects, the date, time and place of the public scoping meetings, and contact information. The NOP solicited participation in determining the scope of the EIS/EIR. On January 28, 2009 the NOP was sent to Responsible and Trustee Agencies and involved federal agencies, to the State Clearinghouse, and parties previously requesting notice in writing. The NOP was also provided to the county clerks of Yolo and Solano counties for a 30 day posting in their respective offices. The 30-day comment period on the NOP was January 28, 2009 to February 28, 2009.

In compliance with the requirements set forth in NEPA, USACE prepared a Notice of Intent (NOI) describing its intent to prepare an EIS/EIR, the proposed action, the possible alternatives, and relevant scoping meeting and contact information. The NOI was posted in the Federal Register, the United States Government's official noticing and reporting publication, on January 27, 2009. The official 30 day comment period for the NOI was January 27, 2009 to February 27, 2009.

Mailings

WSAFCA and the USACE developed a mailing list of West Sacramento parcel owners that are within 100 feet of haul routes and 500 feet of each of the three project-level sites and sent them a postcard invitation to the scoping meetings. Additionally, the City Lights newsletter, which is developed by the City, featured an article describing the WSLIP and noted the times and date of the meetings and was mailed to all residences in West Sacramento.

The Rivers Homeowners Association has also been contacted as their community will be directly affected by the levee improvements.

Legal Notices

Legal notices briefly introducing the lead agencies, the proposed WSLIP, and publicizing the scoping meetings were placed in the Sacramento Bee and the West Sacramento News-Ledger newspapers. The Sacramento Bee was intended to reach a regional public audience, and the West Sacramento News Ledger is a local newspaper that residents routinely rely upon to keep them abreast of City of West Sacramento activities. The notice was published in the Sacramento Bee and in the News-Ledger on Feb. 4, 2009.Because it was not a working day for some resource agencies on February 12 due to the observance of President's Day, USACE and WSAFCA conducted additional outreach to those agencies to ensure their comments on the scope were included. Telephone calls were made to 15 agencies that had previously been sent the NOP to ensure they received the NOP and determine if they intended to comment on the scope of the EIS/EIR. Up to two calls per agency were made in an attempt to contact them and invite them to provide their input on the scope of the EIS/EIR. The correspondence and outcome of each call was documented.

Appendix A contains copies of the following:

- Notice of Preparation (including resource agency mailing list)
- Notice of Intent
- Post card meeting invitation
- Resident mailing list
- City Lights newsletter
- Sacramento Bee and West Sacramento News Ledger public notices
- List of resource agencies contacted and call log

Public Meetings

Two public scoping meetings were held to inform the public of the proposed WSLIP and provide them an opportunity to provide comment and input on the range of alternatives, environmental effects, and any issues of concern they may have related to the proposed WSLIP. The two meetings were held on the same day, February 12, 2009; one from 3:30 to 5:30 p.m. and the other from 6:30 to 8:30 p.m., at the West Sacramento City Hall Galleria room. The meeting location was chosen as it is central to the West Sacramento community. The meeting times were chosen to accommodate both the work day schedules of public agency representatives and the general public, including residents and business owners.

The meetings were open-house style workshops in which attendees could read and view the information on about the WSLIP and interact with project staff including WSAFCA, USACE, the City, MBK and HDR Engineering consultant staff, and ICF Jones & Stokes environmental consulting staff.

Twenty-four graphic display boards were on display for attendees to review. The boards described and illustrated the WSLIP history, purpose, need and objectives, study area, levee deficiencies and potential improvements, environmental considerations, the CEQA/NEPA process and project timeline and were on display for attendees to review. WSLIP staff was stationed at display boards to interact with public attendees and provide additional detail or answer any questions.

A brief Power Point presentation was given to provide a brief introduction to the WSLIP objectives, schedule, environmental compliance, and related flood control work in the region.

A fact sheet was prepared and available for attendees to take with them. The fact sheet provided an overview of the WSLIP and its objectives, the study area, the environmental compliance process and some frequently asked questions provided answers relating to issues such as effects to the community, current levee safety, and funding.

Comment cards were prepared so that meeting attendees could provide feedback on the WSLIP. These cards could be filled out during the meeting and given to a project team member or filled out after the meeting and sent to the City before Feb. 28, 2009.

Appendix B contains copies of the following:

- display boards
- Power Point presentation
- Fact sheet
- Comment card

Public Feedback

There were 10 people in total who attended the two meetings. Ten people attended the meeting from 3:30 to 5:30 p.m. and there were no attendees at the second meeting from 6:30 to 8:30 p.m.

Five comments were received from the public regarding this EIS/EIR during the scoping period. Below is a list summarizing the written comments received.

- Special attention should be paid to the CHP Academy site as a portion of that early implementation site area encompasses piping, structures and equipment for the water treatment plant and the City's potable water supply.
- A comment was received regarding attention being paid to Old River Road 22 from West Sacramento to Woodland, which runs over top the Sacramento Weir and is a levee itself, which may have been damaged due to high frequency of semi-trucks on the road.
- A comment was received regarding the permitting of structures at the Rivers site and the City is required to pay for permits previously issued if building is not allowed to occur due to levee deficiencies.

- A comment addressed the vegetation on levees policy.
- A comment addressed how the homeless population living on and around the levees effects the environment.
- The CHP Academy provided comment in support of levee improvements and indicated there would be no direct construction impacts to their facility.
- The lead agencies should work closely with California Department of Fish and Game, U.S. Fish and Wildlife Service, NOAA Fisheries, and other resource agencies to mitigate for and avoid the cumulative loss of riparian vegetation.
- Queries of the Natural Diversity database and the U.S. Fish and Wildlife Special-Status Species database should be conducted to identify special-status species in the region.
- The draft EIS/EIR should consider a range of alternatives to prevent and slow the introduction of invasive species.
- Please include greenhouse gas emissions information consistent with the California Global Warming Solutions Act (AB 32), including an analysis of the amount of greenhouse gas emissions, a comparison of the amount to California inventories, a determination of significance and mitigation measures if required.
- A land and waterside noise and vibration evaluation should be conducted for effects on all plant and wildlife.
- A water quality, cultural resource, recreation, and air quality analysis should be conducted.
- A Central Valley Flood Protection Board encroachment permit may be required in addition to a geotechnical evaluation.

Commenter Mary Lasell also requested WSAFCA send her a graphic used at the meeting to depict the other flood control efforts happening currently in the Sacramento area. This graphic was sent to Ms. Lasell on March 20, 2009.

Appendix C contains copies of the following:

- Comments received from all interested parties

Next Steps

The comments received during the scoping period will assist in determining which issues are evaluated in detail in the EIS/EIR. Once alternatives have been developed based on the scoping process and preexisting information, they will be analyzed, and a draft EIR/EIS will be developed. Upon the release of the draft EIR/EIS in fall 2009, the public will have 60 days to comment on the document. Additionally, at least one public hearing will be held so the public and agencies can learn more about the draft EIR/EIS, ask questions regarding the analysis, and provide comments. At these meetings, the alternatives will be presented and explained.

Once the public comment period on the draft EIR/EIS has concluded, WSAFCA and USACE will consider and respond to all comments and prepare a final EIR/EIS. WSAFCA and USACE will consider all written comments in deciding which alternative(s) to select and implement and document that selection in a record of decision, no sooner than 30 days following publication of the final EIR/EIS.

Public noticing

BILLING CODE: 3720-58

DEPARTMENT OF DEFENSE

Department of the Army; Corps of Engineers

Notice of Intent to Prepare an Environmental Impact Statement/Environmental Impact Report for the West Sacramento Levee Improvements Program, West Sacramento, CA

AGENCY: Department of the Army, U.S. Army Corps of Engineers; DoD.

ACTION: Notice of intent.

SUMMARY: The action being taken is the preparation of a programmatic and project-specific Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the West Sacramento Levee Improvements Program (WSLIP) in Yolo County and Solano County, CA. Under 33 U.S.C. 408, the Chief of Engineers grants permission to alter an existing flood control structure if it is not injurious to the public interest and does not impair the usefulness of such work. Under Section 404 of the Clean Water Act, the District Engineer permits the discharge of dredged or fill material into waters of the United States if the discharge meets the requirements for the Environmental Protection Agency's 404 (b)(1) guidelines and is not contrary to the public interest. The U.S Army Corps of Engineers (Corps) will consider granting both 408 permission to the Central Valley Flood Protection Board (CVFPB) and 404 permit to West Sacramento Area Flood Control Agency (WSAFCA) for their work on the WSLIP. The CVFPB and WSAFCA are requesting this permission and permit in order to reduce flood risk the City of West Sacramento by meeting the following objectives for the project:

- Achieve a minimum of a 200-year level (an event that has a 0.5% chance of occurring in any given year) of flood protection for the entire City by improving approximately 50 miles of levees that protect it;
- Construct levee improvements as soon as possible to reduce flood risk as quickly as possible; and,
- Provide recreational and open space elements for the City that are compatible with flood improvement actions.

DATES: A public scoping meeting will be held on February 12, 2009 at 3:30 p.m. and 6:30 p.m. at the West Sacramento City Hall (see **ADDRESSES**). Send written comments by February 24, 2009 to (see **ADDRESSES**).

ADDRESSES: Public Scoping meeting, West Sacramento City Hall, 1110 West Capitol Avenue, West Sacramento, CA. Send written comments and suggestions concerning this study to Mr. Brian Buttazoni, U.S. Army Corps of Engineers, Sacramento District, Attn: Planning Division (CESPK-PD-RA), 1325 J Street, Sacramento, CA 95814 or to Mr. John Powderly, City of West Sacramento, 1110 West Capitol, Sacramento, CA 95691. Requests to be placed on the mailing list should also be sent to this address.

FOR FURTHER INFORMATION CONTACT: Questions about the proposed action and EIS/EIR should be addressed to Brian Buttazoni at (916) 557-6956, e-mail *Brian.L.Buttazoni@usace.army.mil* or John Powderly at (916) 617-4674, e-mail *johnp@cityofwestsacramento.org* or by mail (see **ADDRESSES**).

SUPPLEMENTARY INFORMATION:

1. **Proposed Action.** The Corps and WSAFCA are preparing an EIS/EIR to analyze the impacts of the work proposed in WSLIP. The Corps will serve as the lead agency under the provisions of NEPA and WSAFCA will serve as the lead agency under the provisions of the California Environmental Quality Act (CEQA).

Several studies have been conducted since 1989 by the Corps, California Department of Water Resources (DWR), and WSAFCA to evaluate the condition of the various levees protecting the City of West Sacramento. These studies have indicated that the levee system is deficient and that the consequences of levee failure from a major flood event would be significant.

Since the early 1990s, WSAFCA and its partners have undertaken several levee repair projects to address urgent levee deficiencies that pose serious flood risk. Many of these repair projects were the result of deficiencies noted during routine operations and maintenance inspections and repairs were performed on a case-by-case basis.

In July 2006, in response to new Corps design standards and the Federal Emergency Management Agency's (FEMA) Flood Insurance Rate Map modernization program, the City, as part of WSAFCA, determined that it was necessary to perform a comprehensive evaluation of all of the levees protecting the City to more definitely determine its current level of flood protection, determine the magnitude and severity of any deficiencies, and develop recommended strategies for improvement. For this most recent comprehensive evaluation, the levees were evaluated according to the latest Corps criteria for stability, seepage, erosion, geometry, and levee height. Data collected from the evaluation showed that much of the existing system does not provide protection from

a 100-year flood event (an event having a 1% chance of occurring in any given year), the commonly accepted minimum level of flood protection.

WSAFCA has identified the primary deficiencies of the levee system, which include: inadequate levee height, through-seepage and under-seepage, slope stability, seismic vulnerability, erosion, and non-compliant vegetation. The study area of the WSLJP includes the entire WSAFCA boundaries (over 50 miles of levees) which encompasses portions of the Sacramento River, the Yolo Bypass, the Sacramento Bypass, and the Sacramento Deep Water Ship Channel (DWSC). The study area has been subdivided into the following sub-reaches: Sacramento River Levee North, Sacramento River Levee South, Port North Levee, Port South Levee, South Cross Levee, Deep Water Ship Channel Levee East, Deep Water Ship Channel Levee West, Yolo Bypass Levee, and Sacramento Bypass Levee.

2. Alternatives. The EIS/EIR will address an array of flood control improvement alternatives at the *program level.* Alternatives analyzed during the investigation will include a combination of one or more flood protection measures. These measures include raising the existing levee; constructing an adjacent setback levee, cutoff walls, seepage berms, stability berms, internal drains, relief wells, or sheet-pile walls; slope flattening; placing stone protection; and vegetation removal.

Measures may be applied individually or combined to address deficiencies. For example, a seepage deficiency may be addressed by utilizing a seepage berm or a relief well, or a combination of both. Because each reach has a specific set of levee deficiencies and each levee deficiency has a number of different measures that could be utilized to improve the levee, WSAFCA is proposing to develop a range of alternatives

on a reach-by-reach basis rather than basin-wide to provide greater flexibility. Constraints that would be considered during the development of alternatives for each reach could include land use (i.e., development immediately adjacent to the levee), available area for various types of construction activities necessary to construct improvements, and other environmental effects. Future actions analyzed at the program level may or may not require additional analysis under a separate tiered environmental document(s). A No-Action Alternative will be analyzed at the program level.

Three sites have been identified that would be analyzed at the *project level* and included within the EIS/EIR. Also known as "Early Implementation Projects," these sites are known as CHP Academy, The Rivers, and the Sac Bank Extension Site. Analysis for the sites considered at the project level will include the analysis of No Action, a Preferred Alternative, and any other alternatives considered.

- ***CHP Academy Site.*** This site includes 4,500 feet of the Sacramento Bypass Levee and the northern 2,000 feet of the Sacramento River West North Levee, for a total length of 6,500 feet. Deficiencies include through-seepage and geometry. Under-seepage and stability deficiencies are also present in smaller pockets within this reach.
- ***The Rivers Site.*** This site is located just north of the confluence of the Sacramento and American Rivers, incorporating part of The Rivers residential development. The site extends from station 70+00 to station 115+00 on the Sacramento River, for a total length of approximately 4,500 feet. The site exhibits geometry, stability, and under-seepage deficiencies.

- ***Sac Bank Extension Site.*** This site is located just south of the barge canal on the Sacramento River and is the northern most end of the Sacramento River West South Levee. The site extends from station 270+00 to 332+50 for a total length of 6,250 feet. The site generally exhibits under-seepage, stability, and geometry deficiencies. There are a few locations which have erosion and levee height deficiencies as well. This site adjoins, complements, and extends a separate Corps project under the Sacramento River Bank Protection Project.

3. Scoping Process. *a.* Public scoping meetings will be held on February 12, 2009 to present information and to receive comments from the public. The Corps, with WSAFCA, has initiated a process to involve concerned individuals, and local, State, and Federal agencies.

b. Significant issues to be analyzed in depth in the EIS/EIR include effects on aesthetics, biological resources, hazards and hazardous materials, mineral resources, public services, utilities/service systems, agricultural resources, cultural resources, hydrology/water quality, noise, recreation, air quality, geology/soils, land use/planning, population/housing, transportation/traffic, and cumulative effects of related projects in the study area.

c. The Corps will consult with the State Historic Preservation Officer to comply with the National Historic Preservation Act, the U.S. Fish and Wildlife Service (FWS) and National Oceanic and Atmospheric Administration Fisheries Service to comply with the Endangered Species Act and the FWS to provide a Fish and Wildlife Coordination Act Report as an appendix to the EIS/EIR. Coordination will also be carried out with Native American and tribal groups. Consultation will be carried out on the three project

level sites analyzed in the document. Those reaches considered at the program level would be fully analyzed in the future under separate tiered environmental document(s) and consultation would be carried out at that time.

d. A 45-day public review period will be provided for individuals and agencies to review and comment on the draft EIS/EIR. All interested parties are encouraged to respond to this notice and provide a current address if they wish to be notified of the draft EIS/EIR circulation.

4. Availability. The draft EIS/EIR is anticipated to be available for public review and comment in mid 2009.

Subject: Notice of Preparation of a Draft Environmental Impact Statement/Environmental Impact Report

The United States Army Corps of Engineers (Corps), and the West Sacramento Area Flood Control Agency (WSAFCA) are proposing the West Sacramento Levee Improvements Program (WSLIP). The WSLIP would construct improvements to the levees protecting West Sacramento to meet local and federal flood protection criteria. The Corps, acting as the federal lead agency under the National Environmental Protection Act (NEPA), and WSAFCA, acting as lead agency under the California Environmental Quality Act (CEQA), have determined that an Environmental Impact Statement/Environmental Impact Report (EIS/EIR) will be prepared for the WSLIP. Responsible and trustee agencies under CEQA may include City of West Sacramento, Yolo County, California Department of Fish and Game, California Department of Water Resources, Central Valley Flood Protection Board, California Regional Water Quality Control Board, State Lands Commission, California Department of Parks and Recreation, and U.S. Fish and Wildlife Service.

WSAFCA and the Corps need to know your views regarding the scope and content of the environmental information in connection with the proposed WSLIP. Due to the time limits mandated by state law, your response must be sent at the earliest possible date but not later than 30 days after receipt of this notice (i.e., no later than 5 p.m. on February 29, 2009). Please mail or otherwise deliver your comments to:

John Powderly, Associate Planner
West Sacramento Flood Control Agency
1110 West Capital Avenue, 2nd Floor
West Sacramento, CA 95691
916-617-4645
Email: johnp@cityofwestsacramento.org

U.S Army Corps of Engineers
1325 J Street
Sacramento, CA 95814
916-557-6956
Email: Brian.L.Buttazoni@usace.army.mil

Please provide a name for a contact person in your agency. In addition to or instead of providing written comments, input may also be provided at two public scoping meetings to be held on February 12 at 3:30 p.m. and 6:30 p.m., at the City of West Sacramento City Hall in the Galleria, 1110 West Capitol Avenue, West Sacramento.

Attachment 1 provides the schedule and location of the public scoping meeting and a general description of the proposed WSLIP along with a map of the WSLIP Study Area location. *Attachment 2* discusses the environmental factors potentially affected by the proposed project and the environmental topics to be addressed in the EIS/EIR.

West Sacramento Levee Improvements Program
Draft EIR
Public Scoping Schedule and Program Background

SUMMARY: The action being taken is the preparation of a programmatic and project-specific Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the West Sacramento Levee Improvements Program (WSLIP) in Yolo County and Solano County, CA. Under 33 U.S.C. 408, the Chief of Engineers grants permission to alter an existing flood control structure if it is not injurious to the public interest and does not impair the usefulness of such work. Under Section 404 of the Clean Water Act, the District Engineer permits the discharge of dredged or fill material into waters of the United States if the discharge meets the requirements for the Environmental Protection Agency's 404 (b)(1) guidelines and is not contrary to the public interest. The U.S Army Corps of Engineers (Corps) will consider granting both 408 permission to the Central Valley Flood Protection Board (CVFPB) and 404 permit to West Sacramento Area Flood Control Agency (WSAFCA) for their work on the WSLIP. The CVFPB and WSAFCA are requesting this permission and permit in order to reduce flood risk the City of West Sacramento by meeting the following objectives for the project:

- Achieve a minimum of a 200-year level (an event that has a 0.5% chance of occurring in any given year) of flood protection for the entire City by improving approximately 50 miles of levees that protect it;
- Construct levee improvements as soon as possible to reduce flood risk as quickly as possible; and,
- Provide recreational and open space elements for the City that are compatible with flood improvement actions.

DATES: A public scoping meeting will be held on February 12, 2009 at 3:30 p.m. and 6:30 p.m. at the West Sacramento City Hall (see **ADDRESSES**). Send written comments by February 28, 2009 to (see **ADDRESSES**).

ADDRESSES: Public Scoping meeting will be held at West Sacramento City Hall, 1110 West Capitol Avenue, West Sacramento, CA.

Send written comments and suggestions concerning this study to Mr. Brian Buttazoni, U.S. Army Corps of Engineers, Sacramento District, Attn: Planning Division (CESPK-PD-RA), 1325 J Street, Sacramento, CA 95814 or to Mr. John Powderly, City of West Sacramento, 1110 West Capitol, Sacramento, CA 95691. Requests to be placed on the mailing list should also be sent to this address.

FOR FURTHER INFORMATION CONTACT: Questions about the proposed action and EIS/EIR should be addressed to: Brian Buttazoni at (916) 557-6957 or email at brian.l.buttazoni@usace.army.mil or John Powderly at (916) 617-4674 or email at johnp@cityofwestsacramento.org, or by mail (SEE ADDRESSES ABOVE).

SUPPLEMENTARY INFORMATION:

1. Proposed Action. The Corps and WSAFCA are preparing an EIS EIR to analyze the impacts of the work proposed in WSLIP. The Corps will serve as the lead agency under the provisions of NEPA and WSAFCA will serve as the lead agency under the provisions of the California Environmental Quality Act (CEQA).

Several studies have been conducted since 1989 by the Corps, California Department of Water Resources (DWR), and WSAFCA to evaluate the condition of the various levees protecting the City of West Sacramento. These studies have indicated that the levee system is deficient and that the consequences of levee failure from a major flood event would be significant.

Since the early 1990s, WSAFCA and its partners have undertaken several levee repair projects to address urgent levee deficiencies that pose serious flood risk. Many of these repair projects were the result of deficiencies noted during routine operations and maintenance inspections and repairs were performed on a case-by-case basis.

In July 2006, in response to new Corps design standards and the Federal Emergency Management Agency's (FEMA) Flood Insurance Rate Map modernization program, the City, as part of WSAFCA, determined that it was necessary to perform a comprehensive evaluation of all of the levees protecting the City to more definitely determine its current level of flood protection, determine the magnitude and severity of any deficiencies, and develop recommended strategies for improvement. For this most recent comprehensive evaluation, the levees were evaluated according to the latest Corps criteria for stability, seepage, erosion, geometry, and levee height. Data collected from the evaluation showed that much of the existing system does not provide protection from a 100-year flood event (an event having a 1% chance of occurring in any given year), the commonly accepted minimum level of flood protection.

WSAFCA has identified the primary deficiencies of the levee system, which include: inadequate levee height, through-seepage and under-seepage, slope stability, seismic vulnerability, erosion, and non-compliant vegetation. The study area of the WSLIP includes the entire WSAFCA boundaries (over 50 miles of levees) which encompasses portions of the Sacramento River, the Yolo Bypass, the Sacramento Bypass, and the Sacramento Deep Water Ship Channel (DWSC). The study area has been subdivided into the following sub-reaches: Sacramento River Levee North, Sacramento River Levee South, Port North Levee, Port South Levee, South Cross Levee, Deep Water

Ship Channel Levee East, Deep Water Ship Channel Levee West, Yolo Bypass Levee, and Sacramento Bypass Levee.

2. Alternatives. The EIS/EIR will address an array of flood control improvement alternatives at the *program level*. Alternatives analyzed during the investigation will include a combination of one or more flood protection measures. These measures include raising the existing levee; constructing an adjacent setback levee, cutoff walls, seepage berms, stability berms, internal drains, relief wells, or sheet-pile walls; slope flattening; placing stone protection; and vegetation removal.

Measures may be applied individually or combined to address deficiencies. For example, a seepage deficiency may be addressed by utilizing a seepage berm or a relief well, or a combination of both. Because each reach has a specific set of levee deficiencies and each levee deficiency has a number of different measures that could be utilized to improve the levee, WSAFCA is proposing to develop a range of alternatives on a reach-by-reach basis rather than basin-wide to provide greater flexibility. Constraints that would be considered during the development of alternatives for each reach could include land use (i.e., development immediately adjacent to the levee), available area for various types of construction activities necessary to construct improvements, and other environmental effects. Future actions analyzed at the program level may or may not require additional analysis under a separate tiered environmental document(s). A No-Action Alternative will be analyzed at the program level.

Three sites have been identified that would be analyzed at the *project level* and included within the EIS/EIR. Also known as "Early Implementation Projects," these sites are known as CHP Academy, The Rivers, and the Sac Bank Extension Site. Analysis for the sites considered at the project level will include the analysis of No Action, a Preferred Alternative, and any other alternatives considered.

- ***CHP Academy Site.*** This site includes 4,500 feet of the Sacramento Bypass Levee and the northern 2,000 feet of the Sacramento River West North Levee, for a total length of 6,500 feet. Deficiencies include through-seepage and geometry. Under-seepage and stability deficiencies are also present in smaller pockets within this reach.
- ***The Rivers Site.*** This site is located just north of the confluence of the Sacramento and American Rivers, incorporating part of The Rivers residential development. The site extends from station 70+00 to station 115+00 on the Sacramento River, for a total length of approximately 4,500 feet. The site exhibits geometry, stability, and under-seepage deficiencies.
- ***Sac Bank Extension Site.*** This site is located just south of the barge canal on the Sacramento River and is the northern most end of the Sacramento River West South Levee. The site extends from station 270+00 to 332+50 for a total length of 6,250 feet. The site generally exhibits under-seepage, stability, and geometry deficiencies. There are a few locations which have erosion and levee height deficiencies as well. This site adjoins, complements, and extends a separate Corps project under the Sacramento River Bank Protection Project.

3. Scoping Process.

a. Public scoping meetings will be held on February 12, 2009 to present information and to receive comments from the public. The Corps, with WSAFCA, has initiated a process to involve concerned individuals, and local, State, and Federal agencies.

b. Significant issues to be analyzed in depth in the EIS/EIR include effects on aesthetics, biological resources, hazards and hazardous materials, mineral resources, public services, utilities/service systems, agricultural resources, cultural resources, hydrology/water quality, noise, recreation, air quality, geology/soils, land use/planning, population/housing, transportation/traffic, and cumulative effects of related projects in the study area.

c. The Corps will consult with the State Historic Preservation Officer to comply with the National Historic Preservation Act, the U.S. Fish and Wildlife Service (FWS) and National Oceanic and Atmospheric Administration Fisheries Service to comply with the Endangered Species Act and the FWS to provide a Fish and Wildlife Coordination Act Report as an appendix to the EIS/EIR. Coordination will also be carried out with Native American and tribal groups. Consultation will be carried out on the three project level sites analyzed in the document. Those reaches considered at the program level would be fully analyzed in the future under separate tiered environmental document(s) and consultation would be carried out at that time.

d. A 45-day public review period will be provided for individuals and agencies to review and comment on the draft EIS/EIR. All interested parties are encouraged to respond to this notice and provide a current address if they wish to be notified of the draft EIS/EIR circulation.

4. Availability. The draft EIS/EIR is anticipated to be available for public review and comment in mid 2009.

West Sacramento Flood Improvement Program
Study Area

Notice of Preparation of a Draft Environmental Impact Statement/Environmental Impact Report

The United States Army Corps of Engineers (Corps), and the West Sacramento Area Flood Control Agency (WSAFCA) are proposing the West Sacramento Levee Improvements Program (WSLIP). The Program would construct improvements to the levees protecting West Sacramento to meet local and federal flood protection criteria. The Corps, acting as the federal lead agency under the National Environmental Protection Act (NEPA), and WSAFCA, acting as lead agency under the California Environmental Quality Act (CEQA), have determined that an Environmental Impact Statement/Environmental Impact Report (EIS/EIR) will be prepared for the WSLIP.

WSAFCA and the Corps need to know your views regarding the scope and content of the environmental information in connection with the proposed WSLIP. Due to time limits mandated by state law, your response must be sent at the earliest possible date but not later than 30 days after receipt of this notice (i.e., no later than 5 p.m. on February 28, 2009). Please mail or otherwise deliver your comments to:

John Powderly, Associate Planner
West Sacramento Flood Control Agency
1110 West Capitol Avenue 2nd Floor
West Sacramento, CA 95691

Please provide a name for a contact person in your agency. In addition to or instead of providing written comments, input may also be provided at two public scoping meetings to be held on February 12 at 3:30 p.m. and 6:30 p.m., in the Galleria, 1110 West Capitol Avenue, West Sacramento.

City of West Sacramento
Levee Improvements Program

The U.S. Army Corps of Engineers (Corps), the West Sacramento Area Flood Control Agency (WSAFCA), and the City of West Sacramento (the City) will be working in your neighborhood to improve flood protection.

Join us at a public scoping meeting to learn more about the West Sacramento Levee Improvements Program (WSLIP) and to provide input on the associated Environmental Impact Statement/Environmental Impact Report (EIS/EIR).

WSAFCA and the City held a scoping meeting in November 2007 regarding the development of an EIR for this levee improvement program. Now that the Corps has joined the project as the federal lead agency, the upcoming scoping meeting will focus on the development of a joint EIS/EIR. The EIS portion will fulfill federal requirements, as the EIR fulfills state requirements. The EIS/EIR will disclose the environmental effects that may result from implementation of the WSLIP.

The goal of the WSLIP is to achieve a 200-year level of flood protection for West Sacramento residents.

For More Information

- John Powderly, Associate Planner, City of West Sacramento at (916) 617-4645
- Brian Buttazoni, Biological Scientist, US Army Corps of Engineers (916) 557-6956

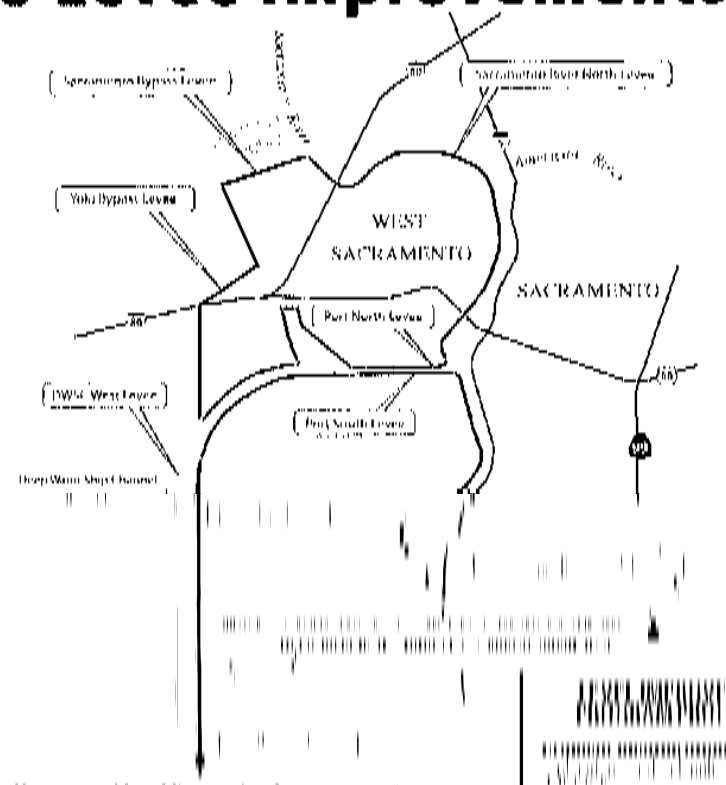
West Sacramento Levee Improvements Program

Progress and Announcement of Public Meeting



The West Sacramento Area Flood Control Agency (WSAFCA) and the City are continuing to move forward with the West Sacramento levee improvements program. The goal of the improvement program is to achieve a 200 year level of flood protection for West Sacramento. A program this large takes many years to implement, but some progress can already be celebrated. Ahead of the levee improvements program, WSAFCA and the City completed the design, environmental documentation, and permitting for a levee improvement project near the I Street Bridge, using assessment funds approved by West Sacramento voters to achieve greater flood safety. After the project began in September 2008, construction was completed in two months' time, a remarkable achievement.

The California Department of Water Resources and the US Army Corps of Engineers have entered in partnership with WSAFCA and the City on the levee projects. Under federal and state law, the projects must comply with both federal and state environmental standards. This compliance includes the drafting of an environmental document describing the environmental effects that may result from the construction and operation of the improved levees.

A public scoping meeting will be held Feb. 12 at City Hall

(1110 West Capitol Ave.) to update the public on the status of the overall levee improvements program and the environmental documentation process. Two meetings scheduled: 3:30 p.m. and 6:30 p.m. Poster boards

proximity within the levee. The utility relocation involved the relocation of over twenty fiber-optic communication conduits. Much of the work fronted the new CalSTRS building on the riverfront.

Now that the levee has been improved to current standards, the existing riverwalk can be extended north toward the I Street Bridge. This riverwalk extension project has already begun. But was put on hold during the levee improvements. This project will continue through the winter, depending on the weather, and is expected to be completed next spring.

The next levee projects will begin in early 2011, after completion of the required environmental reports.

[illegible] *Is your property protected by flood insurance? The City strongly recommends that ALL residents and businesses in West Sacramento purchase and maintain flood insurance policies.*

The Federal Emergency Management Agency (FEMA) is requiring that levees throughout the nation be evaluated to determine if they meet new federal levee design requirements. FEMA will use evaluation results to update flood insurance Rate Maps, which show the level of flood risk in each community. Property owners in communities with high flood risk and federally-backed mortgages on their property will be required to purchase flood insurance policies. Those who purchase and maintain flood insurance now, before new Flood Insurance Rate Maps are finalized, will pay less for insurance than those who wait.

Here's how it works: FEMA's current Flood Insurance Rate Maps show West Sacramento as an "X" Zone, meaning it has a low risk for flooding (based on previous federal levee design requirements). Property owners who currently carry flood insurance pay $700+ per year. However, in the event that the evaluations of West Sacramento's levees, under the new FEMA standards, show that they don't meet new federal levee design requirements, insurance will be required for property owners with federally-backed mortgages and the price will increase, especially if the property did not have flood insurance previously. FEMA may designate large areas of the city a high risk flood zone ("A" or "AE" Zones on FEMA's maps). The cost for brand new flood insurance, for the same amount of coverage as before, could be approximately $2,700 per year. Those who previously purchased and continually maintained flood insurance will be grandfathered into the "X" Zone designation for flood insurance rating purposes. The low-risk premiums of $700 will no longer apply, but the flood insurance premiums on grandfathered properties will only increase to approximately $1,100 per year.

[illegible] be eligible to receive state and federal funding for necessary flood protection improvements. These funds will add to the evidence of flood damage to structures and land. With the formation of the new district, the prior WSAFCA assessment of 1995 was eliminated. There are four factors used to calculate a parcel's assessment: land use classification, parcel acreage, first floor square footage, and potential depth of flooding. The assessment will be applied annually on property tax bills, and will be subject to a 2 percent maximum increase each year.

[illegible] proximity within the levee. The utility relocation involved the relocation of over twenty fiber-optic communication conduits. Much of the work fronted the new CalSTRS building on the riverfront.

Now that the levee has been improved to current standards, the existing riverwalk can be extended north toward the I Street Bridge. This riverwalk extension project has already begun. But was put on hold during the levee improvements. This project will continue through the winter, depending on the weather, and is expected to be completed next spring.

The next levee projects will begin in early 2011, after completion of the required environmental reports.

[illegible] during the design and permitting process. Slope stability analyses indicate that the levee does not meet the required factor of safety against slope instability. The design team considered several options to address the deficiency, including a landside berm, a waterside berm, or repair along the waterside face of the levee, but after careful hydraulic analysis it was determined that a landside repair was necessary at this site. The project is currently in the design process and the project will go out for construction bids in the spring. The construction work is anticipated to begin late summer or early fall, following the required environmental work.

Engineering and Design – detailed engineering of the treatment

Permitting – obtaining all environmental permits to construct the treatment

Construction – construction of the improvement typically during summer

West Sacramento Levee Improvements Program

Environmental Scoping Workshop

West Sacramento Area Flood Control Agency

U.S. Army Corps of Engineers

Please Sign in Here

Program Overview

West Sacramento Levee Improvements Program Purpose

West Sacramento Area Flood Control Agency (WSAFCA) is proposing the West Sacramento Levee Improvements Program (WSLIP) to improve West Sacramento's protection from flooding hazards.

Flood events in the last few decades have prompted reevaluation of levees throughout the United States. If the Sacramento region were to experience significant rainfall events similar to those in 1986 and 1997, multiple levee failures could occur and cause significant flooding and damages.

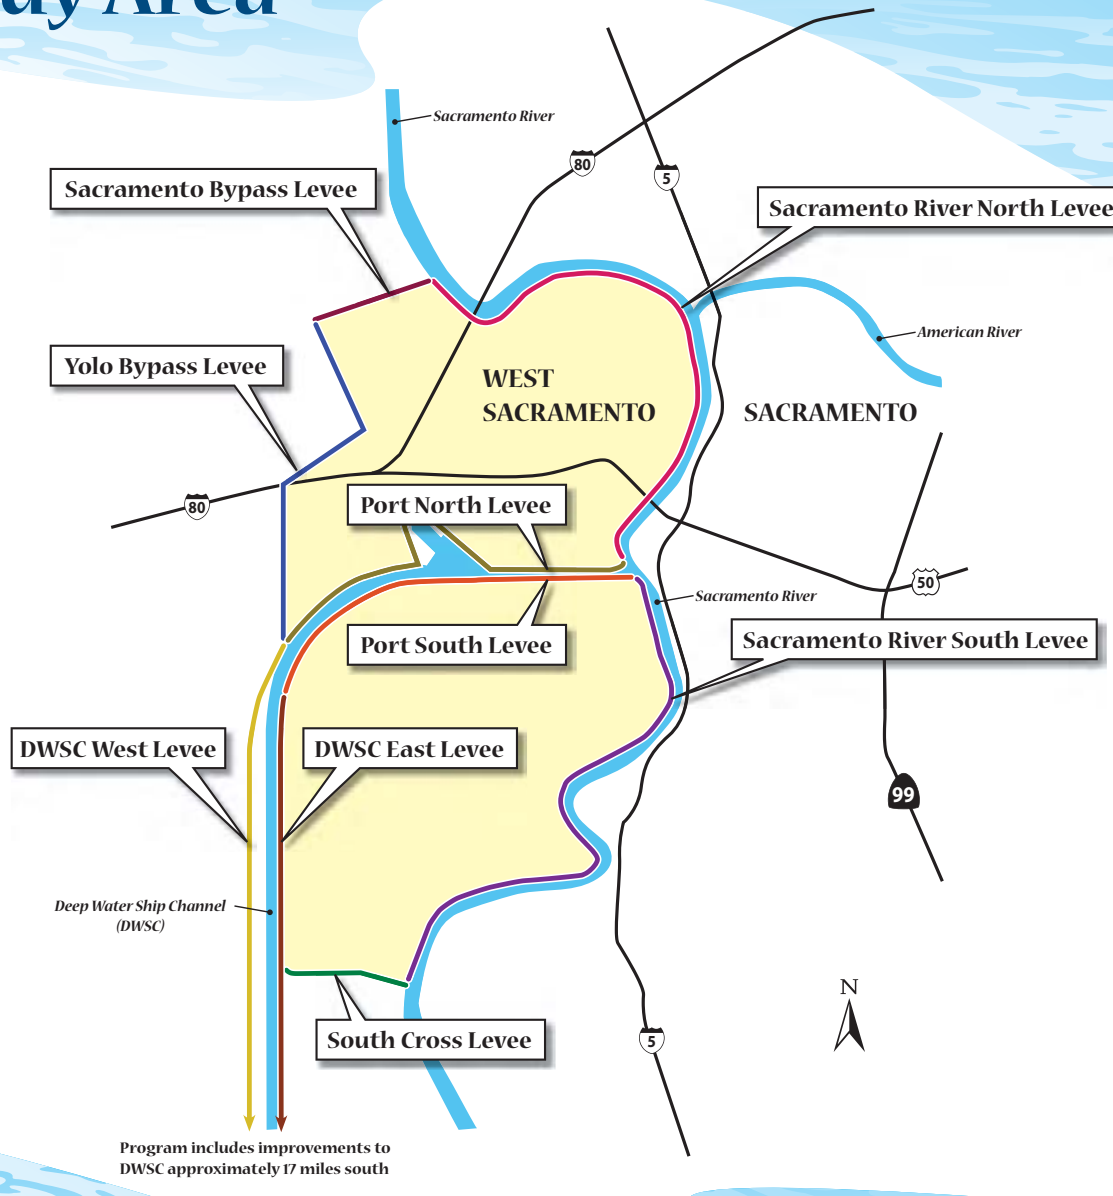
The City of West Sacramento, as part of WSAFCA, and in collaboration with the California Department of Water Resources, recently embarked on a comprehensive evaluation of the levees protecting the City. The U.S. Army Corps of Engineers (Corps) joined forces with WSAFCA in summer 2008 as the lead federal agency with authority over levee modifications.

Preliminary results are in: substantial improvements are necessary. The purpose of the WSLIP is to:

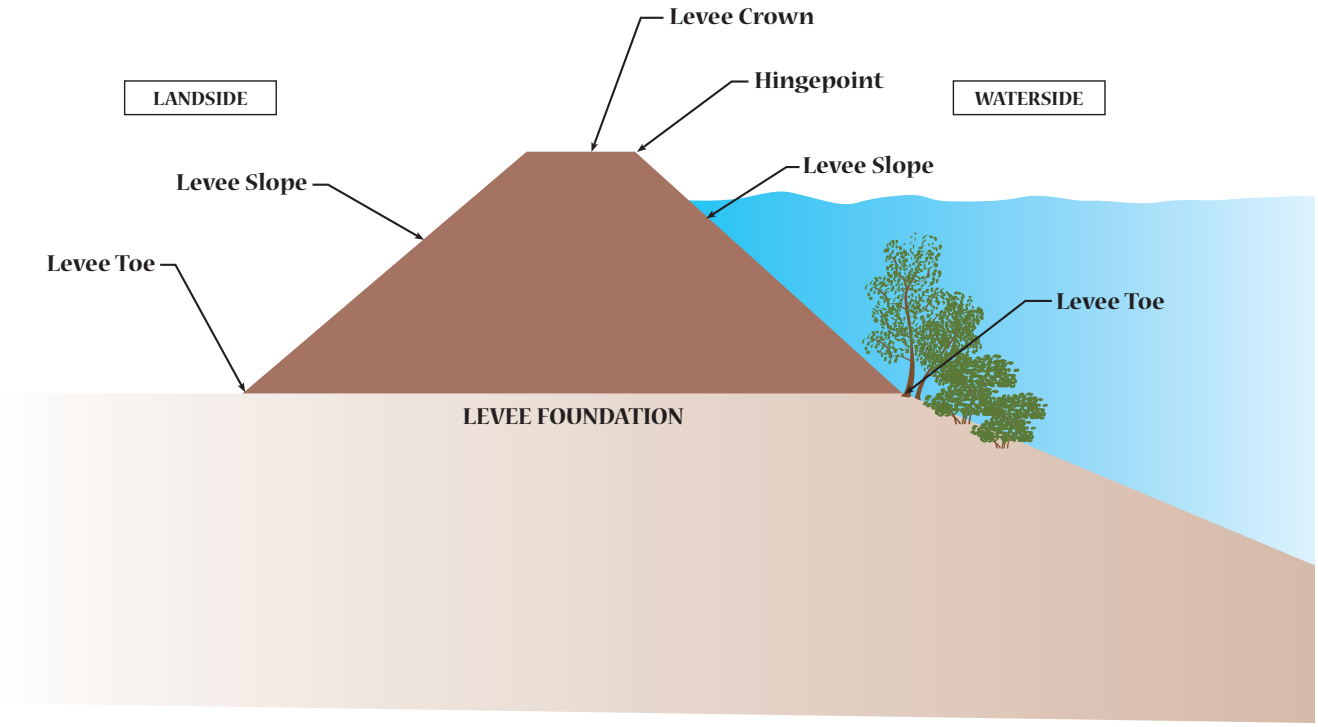
- achieve a minimum of "200-year" level of flood protection for the City of West Sacramento;
- construct levee improvements as soon as possible to reduce flood risk;
- construct levee improvements that are politically, socially, and environmentally acceptable; and
- provide recreational and open space elements for the city that are compatible with flood improvement actions.

West Sacramento Area Flood Control Agency (WSAFCA) is a Joint Powers Authority created in 1994 to coordinate planning and construction of flood protection facilities within its boundaries and to finance the local share of flood control projects. Member agencies of WSAFCA are the City of West Sacramento, California Reclamation District 900, and Reclamation District 537.

The U.S. Army Corps of Engineers provides engineering services to the nation by planning, designing, building and operating water resources projects, including flood control projects on the Sacramento River and San Joaquin Rivers. The USACE is charged with oversight of modifications to federal levees.



How did we get to the West Sacramento Levee Improvements Program?



Over the past decades, there have been several flood protection evaluations and improvements for West Sacramento.

1986:	Significant rainfall event occurs in Sacramento region.
1987:	Corps recommends significant improvements for West Sacramento flood protection.
1987-1990:	City obtains federal funding and authorization for two levee improvements.
1990-1993:	Sacramento Urban Levee Reconstruction Project completes building of stability berm along the Sacramento River in Southport. Costs were $9 million; local share was $800,000.
1994:	WSAFCA was created to coordinate, fund and construct major flood protection improvements.
1997:	Significant rainfall event occurs in Sacramento region and levees sustain damage.
1999-2002:	Corps' West Sacramento Project strengthened five miles of levees adjacent to the Sacramento and Yolo bypasses. Costs were approximately $32.1 million; local share was $3.6 million.
2005:	Corps issues new levee design standards.
2006:	State performs critical erosion repairs on three sites in West Sacramento.
2007:	WSAFCA and the City of West Sacramento, in collaboration with California Department of Water Resources, embark on comprehensive evaluation of levees and propose WSLIP. WSAFCA also proposes an Early Implementation Project (EIP) to prevent seepage along the Sacramento River near I Street Bridge.
2008:	EIP at I Street is constructed. Corps joins as federal lead agency for WSLIP.

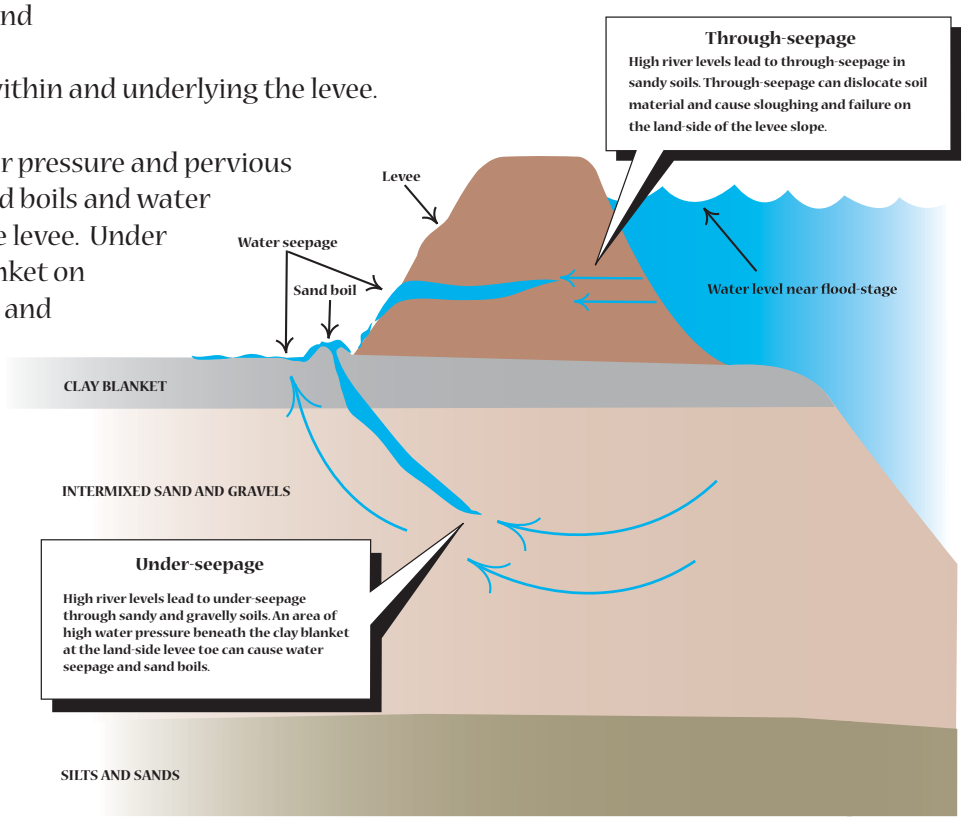
An "Inside Look" at a Levee

Typical Levee Deficiencies



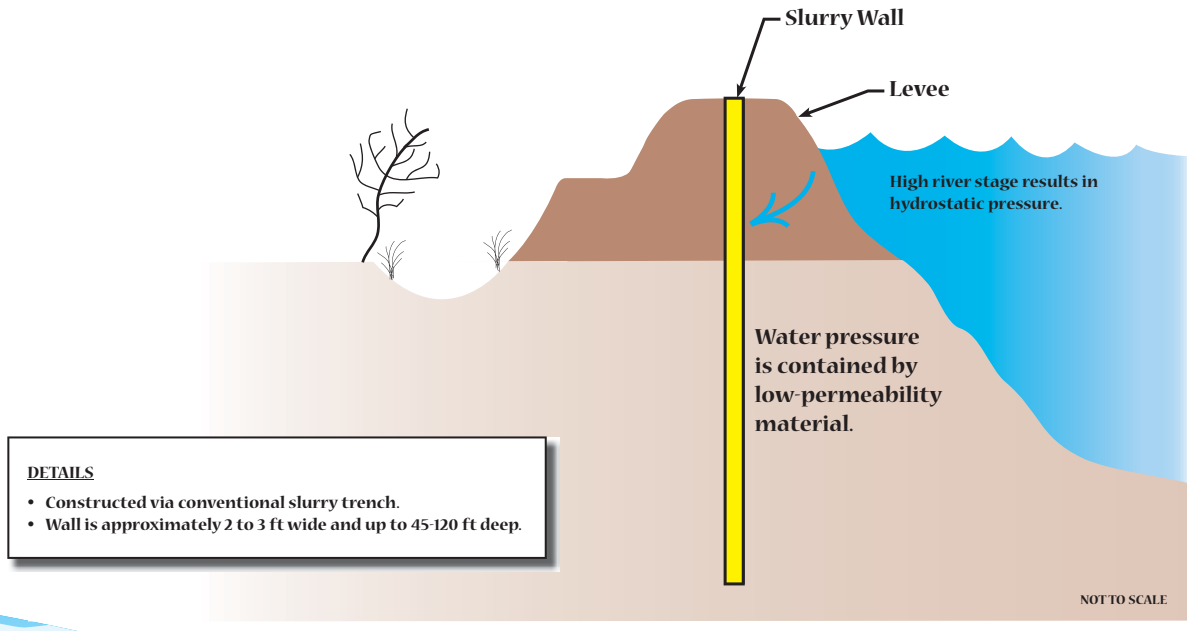
- Unstable Slopes - irregular or overly steep slopes compromise the levee structure
- Inadequate levee height - levee height may be too low relative to predicted water levels
- Non-Compliant Vegetation - this can hinder levee monitoring and maintenance
- Erosion - water flow, wakes and waves, remove soil material, damaging the levee
- Seepage - (see illustration "What is Levee Seepage?")

What is Levee Seepage?

Levee seepage is when water moves away from the river channel, either below or through the levee and surrounding land surface (see diagram below). Two main factors contribute to seepage:

- high water pressure within the river (such as during periods when the river is near flood-stage); and
- pervious earth material within and underlying the levee.

The combination of high water pressure and pervious material can be evident in sand boils and water seepage on the land-side of the levee. Under severe conditions, the clay blanket on the land side may be ruptured and the increased flow of the under-seeping water undermines the levee, causing the levee to breach or collapse.

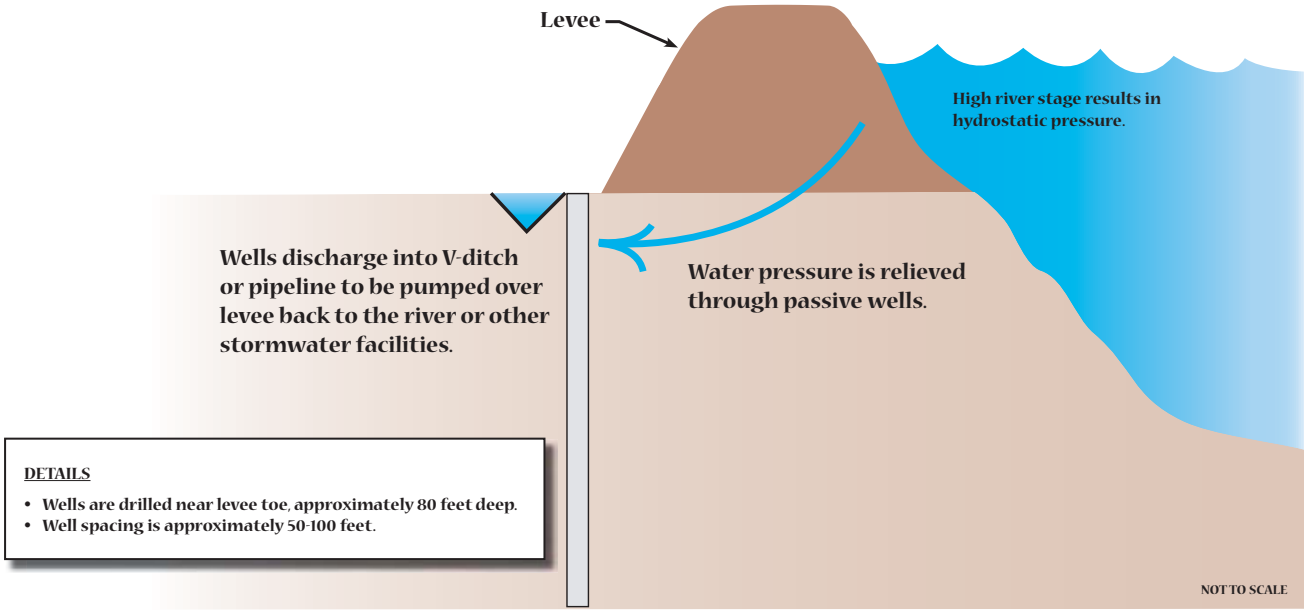


Potential Levee Improvements

Slurry Wall

Concept:

Water pressure is contained and dispersed by a low-permeability wall constructed within the levee cross section.

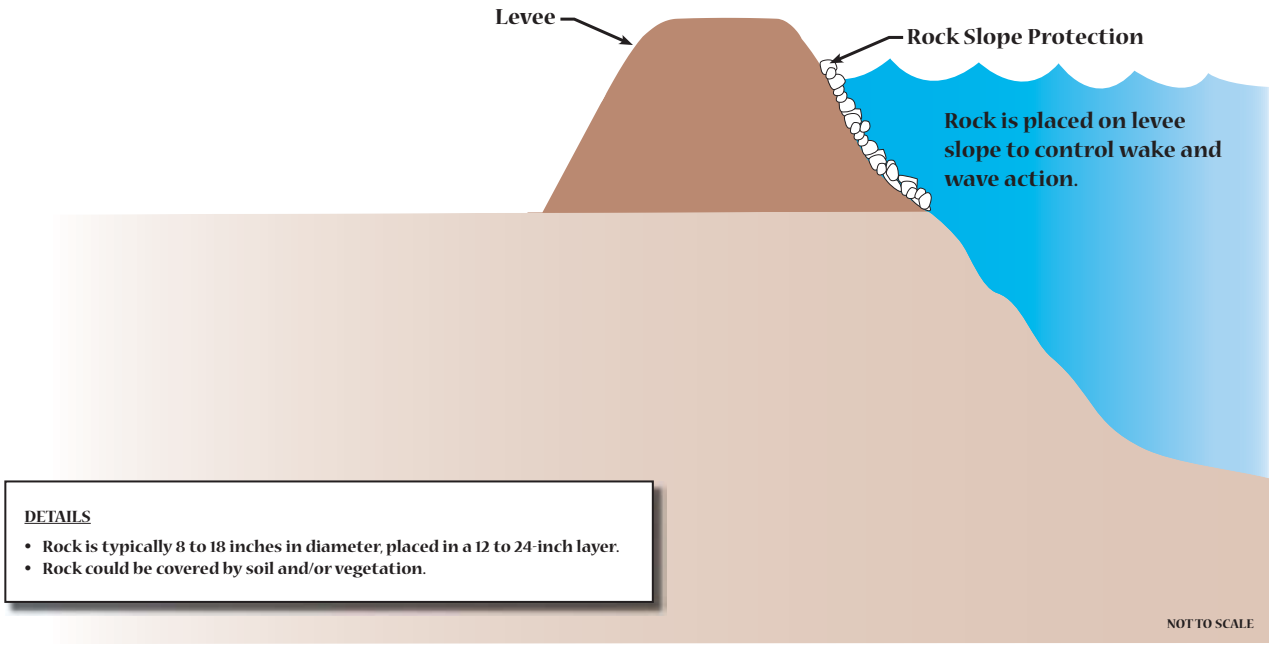


DETAILS

- Constructed via conventional slurry trench.
- Wall is approximately 2 to 3 ft wide and up to 45-120 ft deep.

Relief Wells

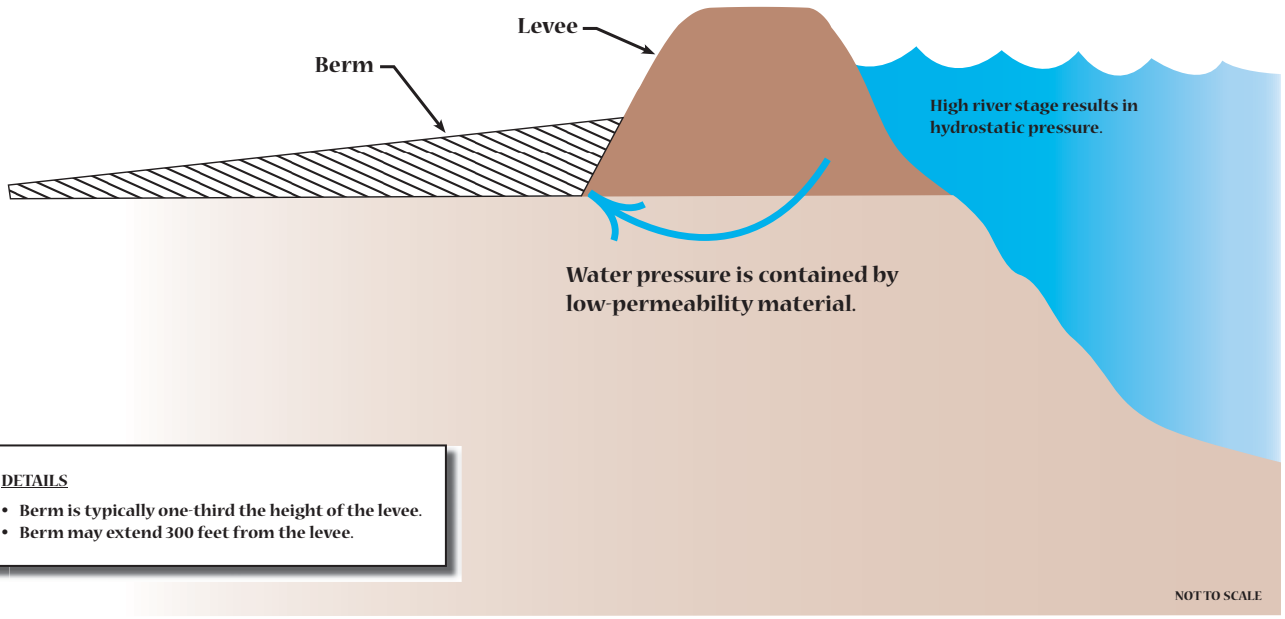
Concept:



Water pressure is relieved via passive wells, which control water discharge into a collection system.

Rock Slope Protection

Concept:

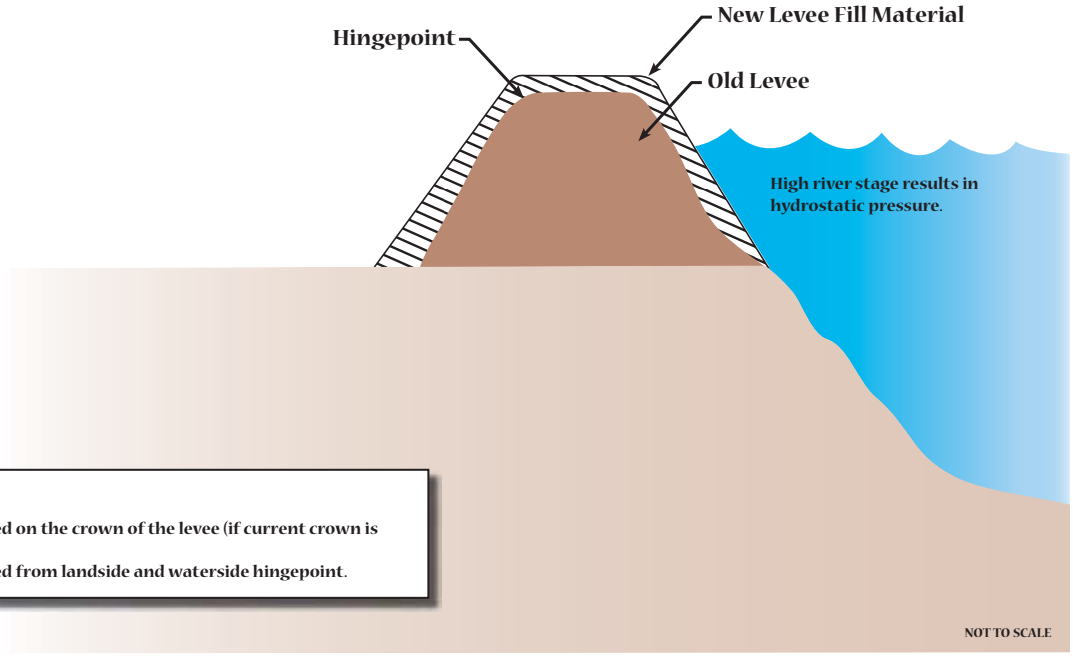


Water-side erosion is prevented by placement of rock.

Seepage Berm

Concept:

Water pressure is contained and dispersed by a thickened soil layer.



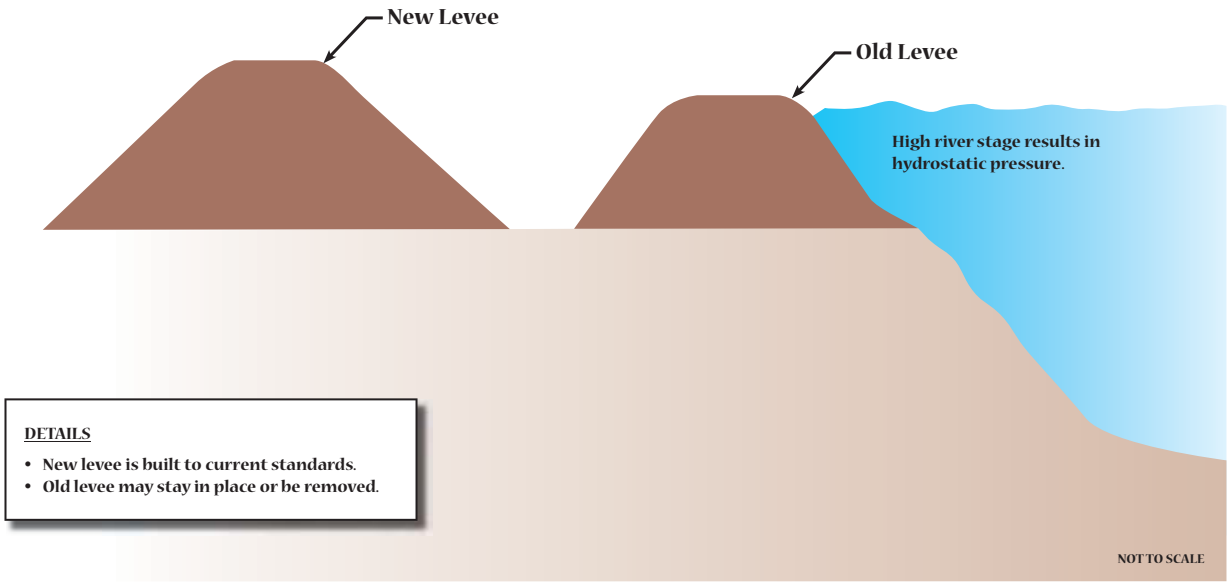
DETAILS

- Berm is typically one-third the height of the levee.
- Berm may extend 300 feet from the levee.

In-Place Levee Raise

Concept:

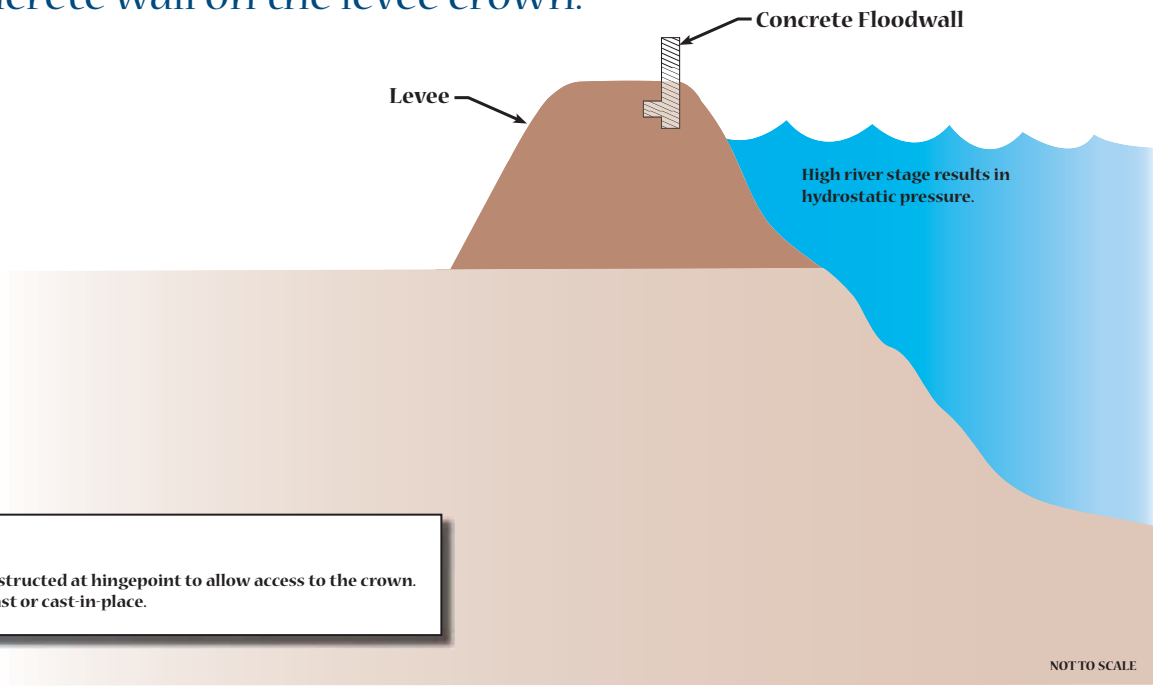
Flood protection is increased by adding material to crown and levee slope (land or water side).



DETAILS

- Material is placed on the crown of the levee (if current crown is wide enough).
- Material is placed from landside and waterside hingepoint.

Setback Levee

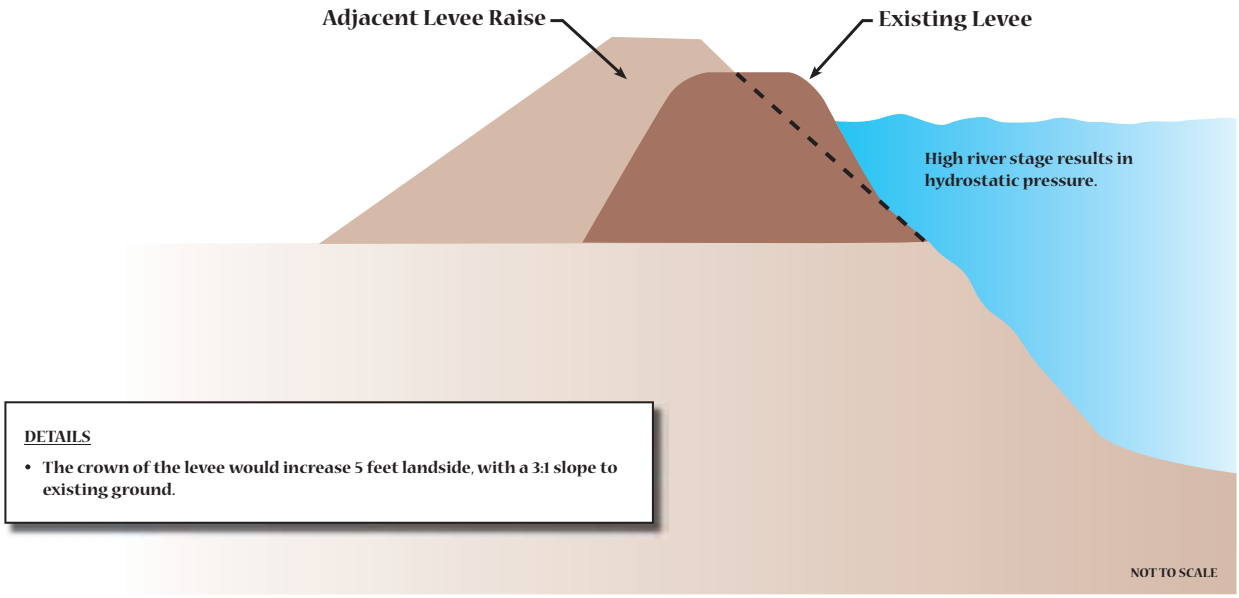


Concept:

A new levee is built toward the landside of an existing levee where the existing levee is not readily repairable or where more flooding capacity is desired.

Floodwall

Concept:
Additional levee height may be achieved through construction of a concrete wall on the levee crown.

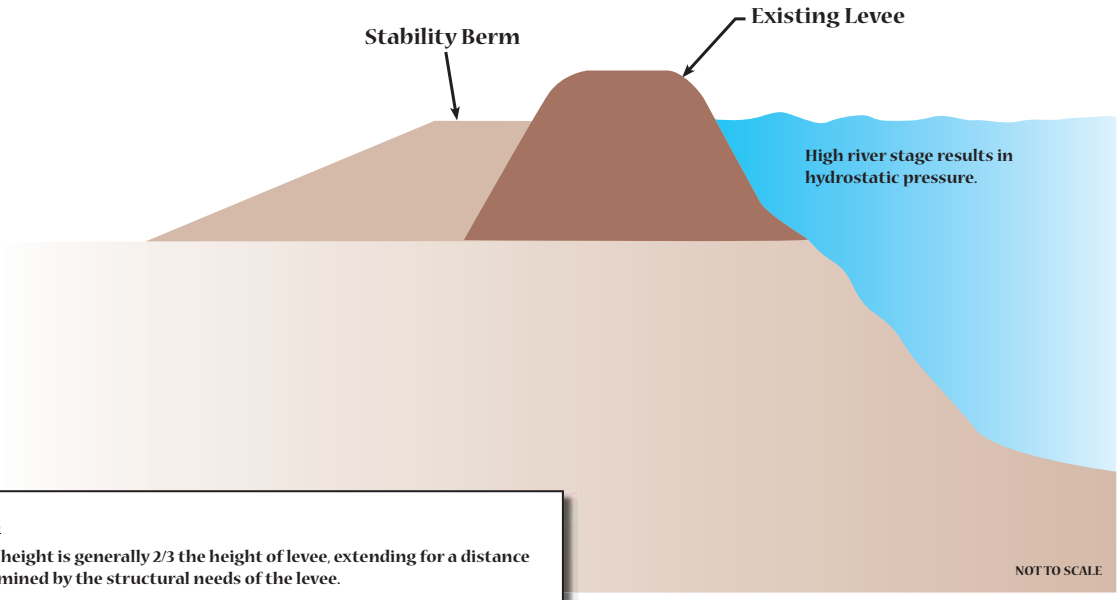


DETAILS

- Typically constructed at hingepoint to allow access to the crown.
- May be pre-cast or cast-in-place.

Adjacent Levee Raise

Concept:
A new embankment strengthens the existing levee and enlarges the slopes.



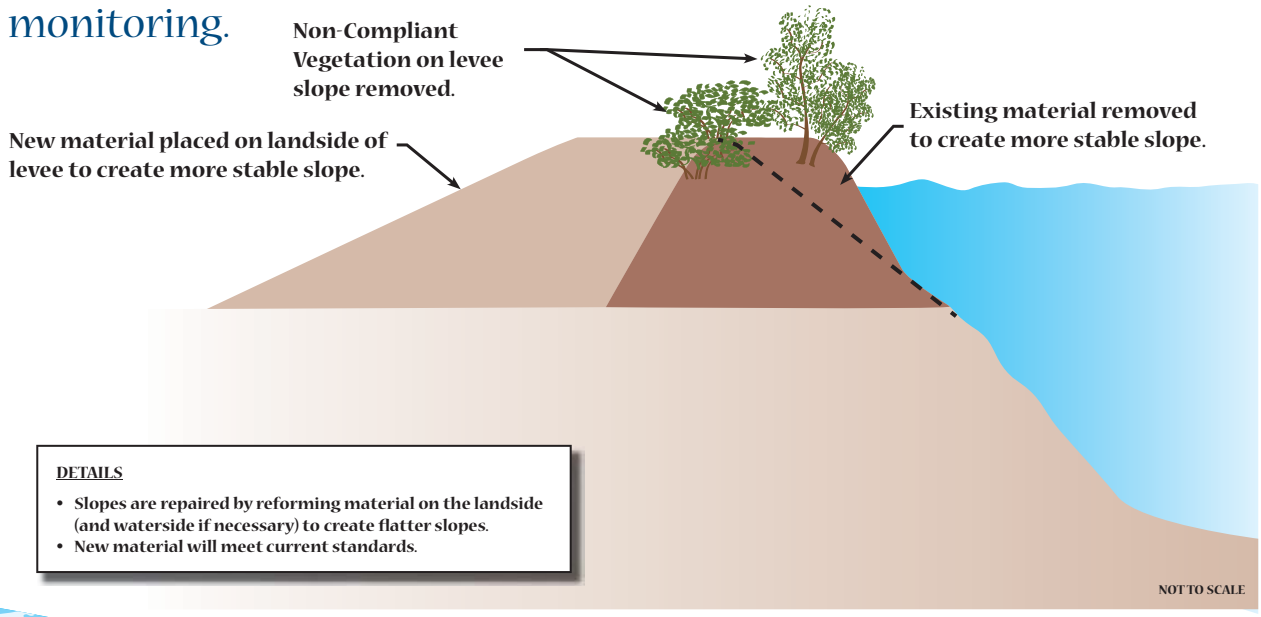
DETAILS

- The crown of the levee would increase 5 feet landside, with a 3:1 slope to existing ground.

Stability Berm

Concept:

Provides additional support to levee to increase strength.



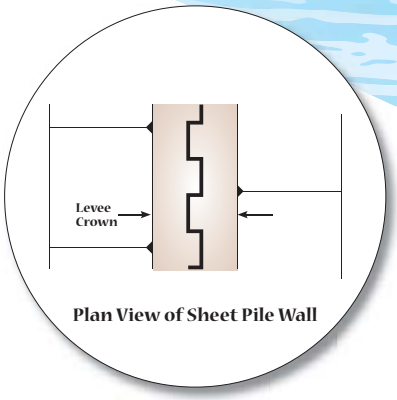
DETAILS

- Berm height is generally 2/3 the height of levee, extending for a distance determined by the structural needs of the levee.

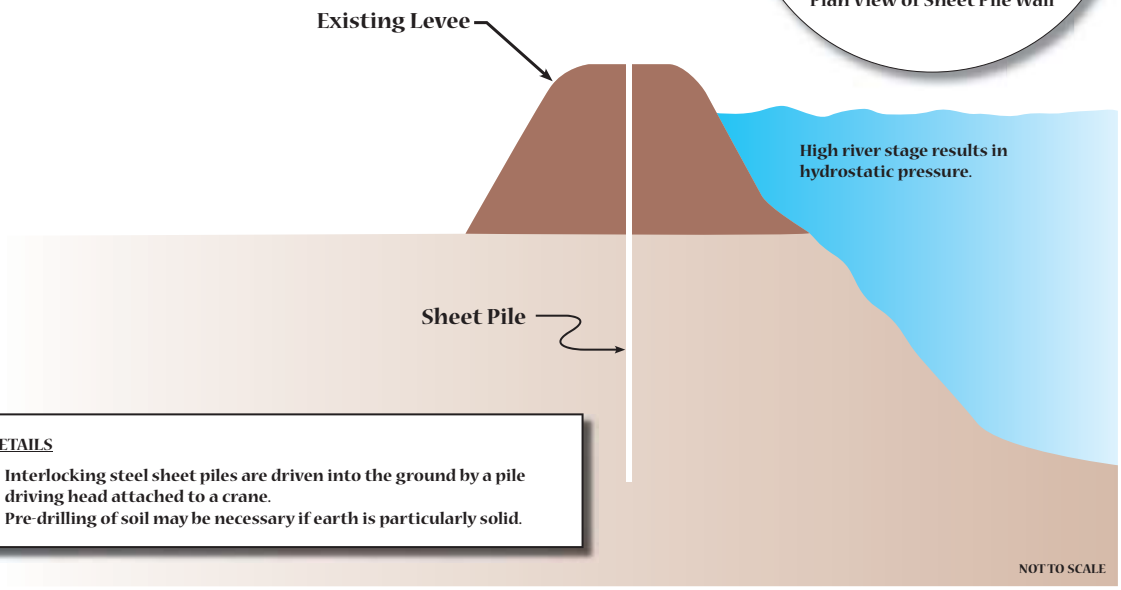
Slope Flattening/ Vegetation Removal

Concept:

Flatter slopes are more stable and less susceptible to erosion. Non-compliant vegetation may inhibit levee maintenance and performance monitoring.



DETAILS

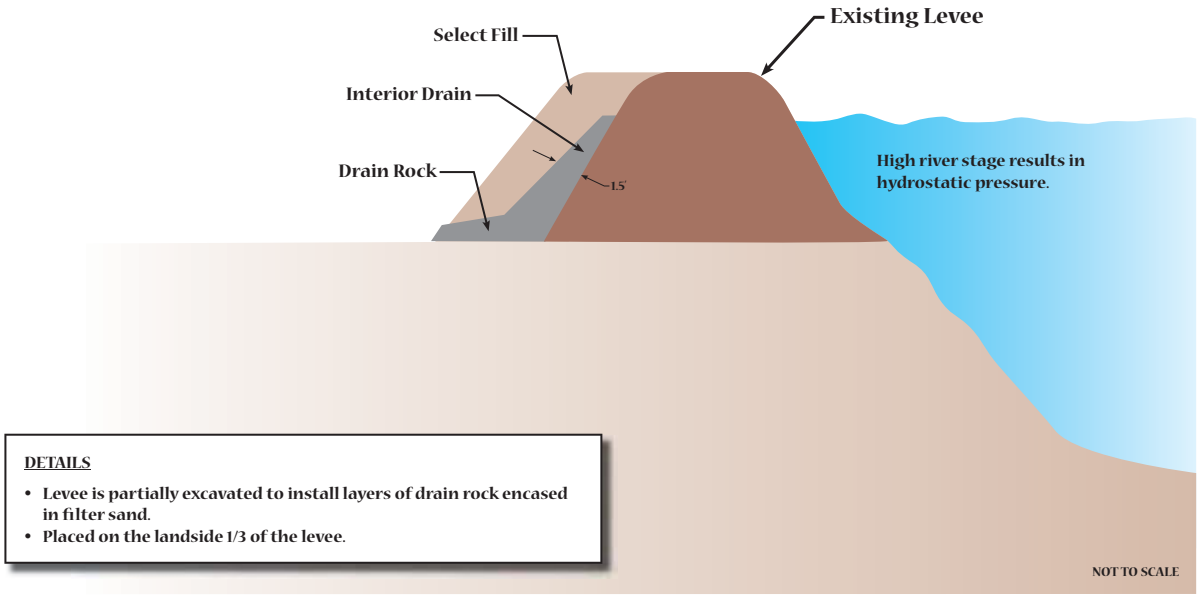


- Slopes are repaired by reforming material on the landside (and waterside if necessary) to create flatter slopes.
- New material will meet current standards.

Sheet Pile Wall

Concept:
Steel panels are driven into the levee core to provide a seepage barrier.

Plan View of Sheet Pile Wall



DETAILS

- Interlocking steel sheet piles are driven into the ground by a pile driving head attached to a crane.
- Pre-drilling of soil may be necessary if earth is particularly solid.

Interior Drain

Concept:

Capture any through-seepage and direct it away from the face of the levee.

DETAILS

- Levee is partially excavated to install layers of drain rock encased in filter sand.
- Placed on the landside 1/3 of the levee.

Planning Process and Early Implementation Projects

Planning Process

A process of addressing three key questions:

(2007-2008)
Problem Identification

Key Question: How do levees compare to current levee design criteria?

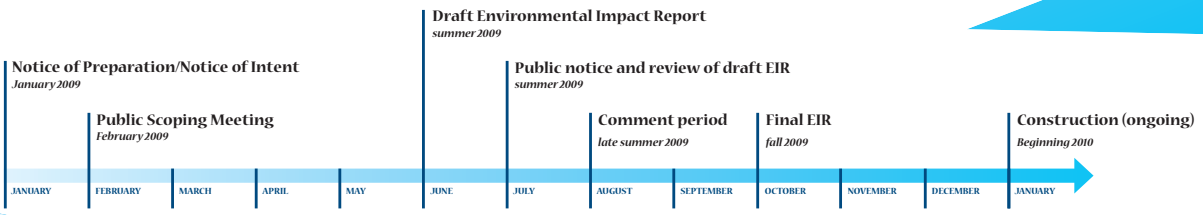
- Soil core drilling and geotechnical analysis to determine soil conditions and the exact geometry (shape) of all the levees;
- Identify where erosion has or is currently occurring;
- Identify the location of all existing utilities.

(2008)
Alternatives Analysis

Key Question: What levee improvements (alternatives) are best for each levee?

- Look at best methods for improving specific levee problems;
- Consider land uses, utilities, or other existing constraints;
- Consider the space required for construction activities;
- Consider whether the improvement is most effective and efficient for the cost.

(2008-2010)
Environmental Analysis – NEPA/CEQA



Key Question: What potential environmental effects could each improvement have in the following areas?

- Water – groundwater, surface water, flood control • Soils and Mineral Resources • Transportation and Navigation • Air quality • Noise • Biological Resources – vegetation, fish, wildlife • Land use – residential, recreational, agricultural • Population and Housing • Utilities and Public Services • Visual Resources • Public Health and Environmental Hazard • Cultural Resources

What is an EIS/EIR?

An EIS/EIR is a detailed document prepared by federal and state Lead Agencies that analyzes a project's potential significant or adverse effects on the human or natural environment and identifies mitigation measures and reasonable alternatives to avoid those effects.

WSLIP Estimated Timeline for NEPA/CEQA

Environmental Considerations

Scoping is an early and open process designed to determine the issues and the alternatives to be addressed in the EIS/EIR.

The following issues have been identified to date:

- riparian vegetation and habitat effects on species such as giant garter snake and valley elderberry longhorn beetle;
- Sacramento River fishery effects on species such as salmon and smelt;
- flood control and river hydraulic effects;
- location of flood control infrastructure and effects on land use and access;
- cultural resources effects; and
- temporary construction effects, such as those on transportation, air quality, and noise

The following agencies will be consulted:

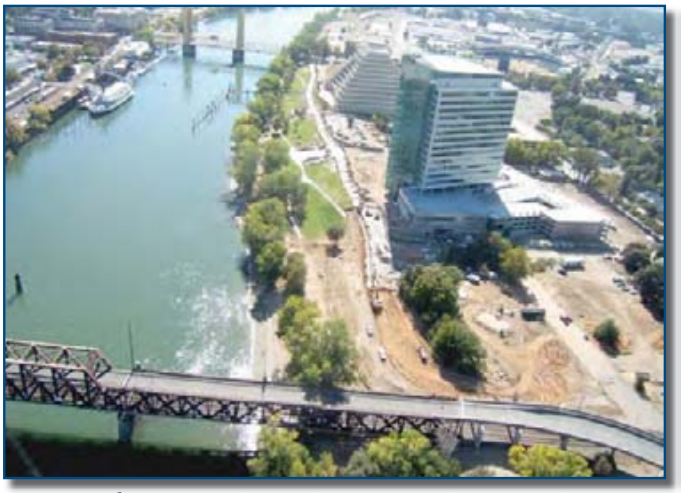
- U.S. Fish and Wildlife Service
- National Marine Fisheries Service;
- California Department of Fish and Game;
- State Office of Historic Preservation;
- Regional Water Quality Control Board; and
- Central Valley Flood Protection Board

Three Newly Proposed EIP Sites

Early Implementation Projects are projects that are implemented in advance of the overall WSLIP to address critical areas where the levee deficiency is well-defined and suitable potential improvements are known. WSAFCA is currently proposing three EIPs, commonly referred to as CHP Academy, The Rivers and Sac Bank Extension Site. In the EIS/EIR, these sites will be analyzed at a *project level*.

- **CHP Academy Site.** This site is approximately 8,500 feet in length, encompassing the Sacramento Bypass Levee and the northern 2,000 feet of the Sacramento River North Levee. Deficiencies at this site are through-seepage and geometry, along with small pockets of under-seepage and stability.

- **The River Site.** This site is approximately 4,500 feet in length and is located on the Sacramento River North Levee, just north of the confluence of the Sacramento and American Rivers, including part of The Rivers residential development. Levee deficiencies at this site include geometry, stability, and under-seepage.



- **Sac Bank Extension Site.** This site is approximately 6,250 feet in length, extending along the Port South Levee and the Sacramento River South Levee, just south of the barge canal on the Sacramento River. Levee deficiencies are under-seepage, stability, and geometry, in addition to a few areas of erosion and insufficient levee height. This site adjoins, complements, and extends a separate Corps project under the Sacramento River Bank Protection Project (Sac Bank).

Completed "I" Street Bridge EIP

WSAFCA and the City completed the first EIP site under the WSLIP at the I Street Bridge location in fall 2008. The improvements for the I Street Bridge EIP site remedied seepage deficiencies in that reach, allowing the City to carry out plans for riverfront recreational improvements. The WSLIP team worked closely with the Corps to complete environmental analysis and permitting required to modify a federal project levee. This successful project resulted in the Corps joining as federal lead agency for the WSLIP. Joining with the Corps enables compliance with the National Environmental Policy Act and a streamlined process for securing future approvals to modify project levees.

The Corps, WSAFCA, and the City will have to undergo the same environmental and permitting processes for the CHP Academy, the Rivers, and the Sacramento Bank Extension sites, as those conducted for the I Street Bridge EIP site.

West Sacramento Levee Improvements Program
Environmental Impact Statement/
Environmental Impact Report

National Environmental Policy Act/
California Environmental Quality Act
Public Scoping Meeting

U.S. Army Corps of Engineers
West Sacramento Area Flood Control Agency

Welcome and Meeting Purpose

- Chris Elliott, Project Manager with ICF Jones & Stokes, environmental consultant for the WSLIP
- Joint Environmental Impact Statement (EIS)/Environmental Impact Report (EIR) is being prepared per the National Environmental Policy Act (NEPA) and California Environmental Quality Act (CEQA)
- Opportunity to describe the program and EIS/EIR process
- Your comments invited to inform the environmental analysis

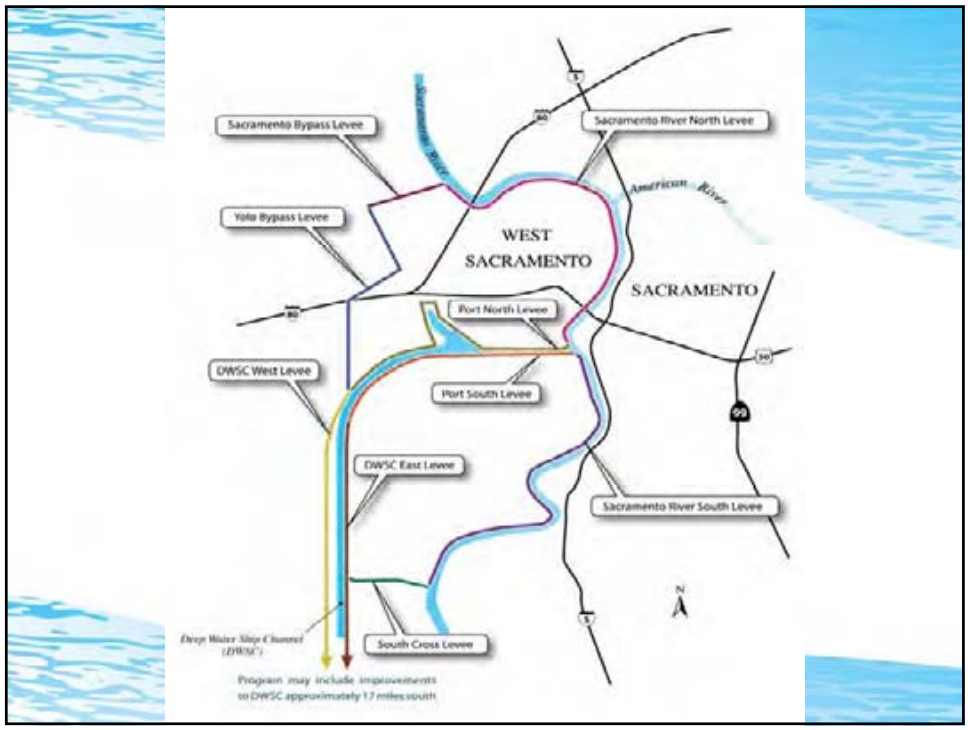
Lead Agencies

- West Sacramento Area Flood Control Agency (WSAFCA)
  - joint powers authority comprised of the City and the reclamation districts that maintain the levees around the City
  - overseeing planning and implementation of the improvements
  - lead agency under CEQA
- U.S. Army Corps of Engineers (USACE)
  - responsible for approval of modifications to federal flood project levees
  - responsible for approval of effects to protected resources under the Clean Water Act
  - lead agency under NEPA

Program Overview

- Communities throughout the Central Valley are at risk to flooding
- Flood issues have national attention (e.g., understanding risk, development within floodplains, level of protection, insurance requirements, climate change effects, flood protection responsibility)
- Revised risk projections (floodplain mapping) and flood protection standards (design and management criteria) have ensued
- Preliminary evaluation indicates improvements are necessary for West Sacramento

Program Objectives



- Achieve a minimum of 200-year (an event that has a 0.5% chance of occurring in any given year) level of flood protection for the entire City by improving the approximately 50 miles of levees that protect it
- Construct levee improvements as soon as possible to reduce flood risk
- Provide recreational and open space elements for the City that are compatible with flood improvement actions

Program History

- Past Flood Protection Efforts
  - 1990-1993: $9 million in repairs to Southport levees
  - 1999-2002: $32 million in repairs on Sacramento and Yolo Bypass levees
  - 2006: 3 levee sites repaired by DWR
- Current Efforts
  - USACE planning repair to Sacramento River levee as part of Sacramento River Bank Protection Project (Sac Bank)
  - WSAFCA conducting comprehensive levee evaluation around entire City (this project)

Study Area

- 50+ miles of levees surrounding City
- Levees divided into nine homogeneous study reaches
- 17 miles along the Deep Water Ship Channel also being evaluated

Planning Process

- Problem Identification – locating and scoping deficiencies
- Alternatives Analysis – matching potential improvements to address the deficiencies
- Environmental Documentation – evaluating possible environmental effects from the potential improvements

Problem Identification – Typical Levee Deficiencies

- Inadequate levee height
- Unstable slopes
- Seepage (under or through the levee)
- Erosion
- Non-compliant vegetation

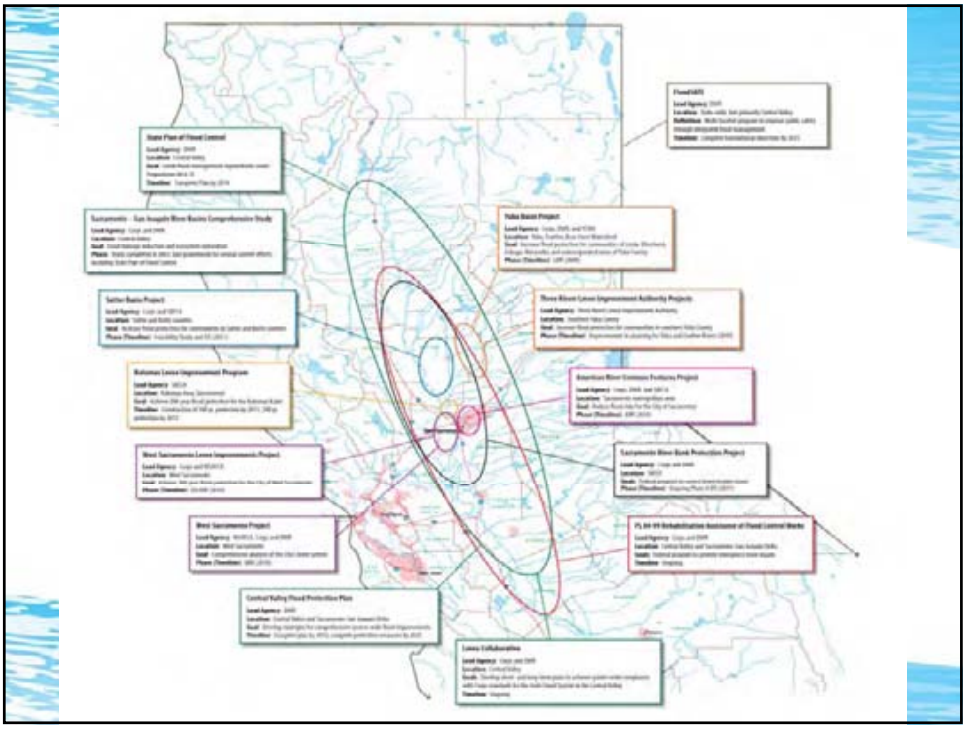
Alternatives Analysis – Possible Improvement Measures

- Raising the existing levee
- Constructing an adjacent or setback levee
- Slope flattening
- Seepage berms or stability berms
- Cutoff walls
- Levee drains and relief wells
- Stone protection
- Removing non-compliant vegetation

Environmental Documentation – Resource Issues

- Fisheries and wildlife, based on potential effects on riparian habitat on and near levees
- Hydrology and hydraulics, based on floodway modification
- Visual resources and recreation, based on removal of non-compliant vegetation
- Temporary construction-related effects, such as traffic, noise, and air quality

Environmental Documentation – Process



- Solicit public input to be considered in conducting the environmental analysis
- Prepare the environmental document
- Circulate draft environmental document for public review and solicit comment
- Review and respond to comments and prepare final environmental document
- WSAFCA adopts project and findings of fact, certifies EIR, adopts mitigation and monitoring plan, and records Notice of Determination
- USACE prepares Record of Decision

Early Implementation

- Sites are under evaluation for early implementation projects (EIPs) to parallel or precede the programmatic study based on nine criteria including
  - greatest improvement in public safety with least negative effects
  - availability of funds
  - integration of multipurpose objectives
- One EIP was completed in 2008
  - I Street Bridge site
- Three EIPs to be considered for 2010/2011 construction
  - CHP Academy site
  - The Rivers site
  - Sac Bank Extension site

Multi-objective Benefits

- Recreation
  - trails along the river corridor for biking and walking
  - river access for fishing and water play
  - passive activities like wildlife viewing and picnicking
- Open Space and Habitat
  - restored areas to mitigate project effects
  - enhancement of fish and aquatic habitat along the river's edge and wetland and upland areas on and near levees

Next Steps

- Ask questions of project team members at this meeting
- Provide written comments via mailed comment card or e-mail by February 28, 2009
- Look for the draft environmental document to be released in summer 2009

FAQ Frequently Asked Questions

Q: ***How safe are the levees surrounding West Sacramento?***

A: *The levees in West Sacramento are currently rated by the Federal Emergency Management Agency as providing a 100-year level of flood protection. However, due to new federal criteria, WSAFCA, USACE and DWR initiated studies to evaluate the levees. The evaluation findings show there are substantial improvements that need to take place. In 2008, WSAFCA completed levee improvement construction at the I Street Bridge EIP site, as part of the WSLIP.*

Q: ***What is the purpose of this project?***

A: *In the past 20 years, the Sacramento Valley has experienced large flood events that destroyed homes, businesses, and agriculture. Although many levees have been improved in the past two decades, improvements are still necessary to meet new levee criteria. To meet these criteria and protect its residents, WSAFCA, partnering with USACE and DWR, will be improving levees in the entire West Sacramento Basin, including parts of the Sacramento River, the Yolo Bypass, the Sacramento Bypass, the Port of Sacramento, and the Sacramento Deep Water Ship Channel.*

Q: ***What problems are typically found within our levees?***

A: *The most typical and serious structural deficiencies found in any levee system, including the levees in West Sacramento, include:*

Erosion *– the breakdown of levee structures can be caused by fast-moving flows, waves, and recreational use of the levees.*

Under-seepage *– when rivers reach flood stage, pressure builds up in the levee substrate, forcing water under the levees and out of the ground. In this case, the integrity of the levee can be severely compromised, leading to failure.*

Through-seepage *– similar to under-seepage, this is seepage that occurs through the levee that can erode the interior and landside slope, leading to failure.*

Inadequate Levee Height*– levee height may be too low relative to predicted water levels during a flood.*

Unstable Slopes *– levees are comprised of irregular or overly steep slopes that can lead to failure.*

Q: ***How will these levee repairs be funded?***

A: *In July 2007, WSAFCA asked voters to pass a new annual parcel assessment from property owners to help raise necessary funds for levee improvements and repairs. The parcel assessment was approved and the monies raised will go toward levee improvements and supplement federal and state funding. In April 2007, the City Council also enacted an ordinance that requires new development to contribute to achieving 200-year flood protection. New development will have an option to demonstrate that new structures have 200-year flood protection or pay a fee in lieu of making physical improvements. This fee will go toward funding levee improvements. USACE and DWR are also funding partners for levee repairs.*

Q: ***How will levee construction affect me?***

A: *Major construction projects will not begin until 2010 or 2011. Typical construction inconveniences may include temporary partial road closures, minor increases in traffic, and construction-related noise.*

Q: ***When will the draft EIS/EIR be available for review? How can I keep up to date on progress?***

A: *The draft EIS/EIR will be available for 45-day review upon release. The tentative release date for the document is summer 2009. At that time, the public is invited to comment on the document, and all comments will be addressed in the final EIS/EIR. At least one public hearing will be held after the release of the draft EIS/EIR. Additionally, WSAFCA can be contacted below for more information regarding the WSLIP.*

West Sacramento Levee Improvements Program

About the WSLIP

In order to achieve the flood protection goals of the City of West Sacramento (City) and comply with current federal and state flood protection criteria, the West Sacramento Area Flood Control Agency (WSAFCA) and the U.S. Army Corps of Engineers (USACE) is proposing the West Sacramento Levee Improvements Program (WSLIP). The primary goal of the WSLIP is to achieve a 200-year level of flood protection for all those who live, work, or visit the City. Reaching a 200-year level of flood protection would protect the City from a flood event that has a half-percent chance of occurring in any given year. The WSLIP has the following objectives:

- provide a **comprehensive evaluation** of the entire levee system that protects the city (approximately 50 miles),
- develop **recommended strategies** to reach 200-year level of flood protection,
- provide a **basis for partnerships** with federal and state agencies to implement levee improvements, and
- provide **recreational and open space elements** for City residents that are compatible with flood improvement actions.

Based on lessons learned about levee failures throughout the nation and new design criteria for levees, WSAFCA began evaluation of the West Sacramento levee system as part of the WSLIP in 2006. WSAFCA engaged a consultant team of geotechnical engineers, flood protection and water resources engineers, and environmental consultants to evaluate nine reaches (i.e., geographic sections) of the levee system to determine deficiencies and solutions.

Some of the levee deficiencies that have been identified to date include erosion, seepage (through and under the levees), inadequate levee height, and unstable slopes. Potential treatments for these deficiencies include slurry cutoff walls, setback levees, seepage berms, and rock slope protection. Improvements for each reach will be determined based on criteria such as protection provided, construction costs, environmental considerations, and overall feasibility.

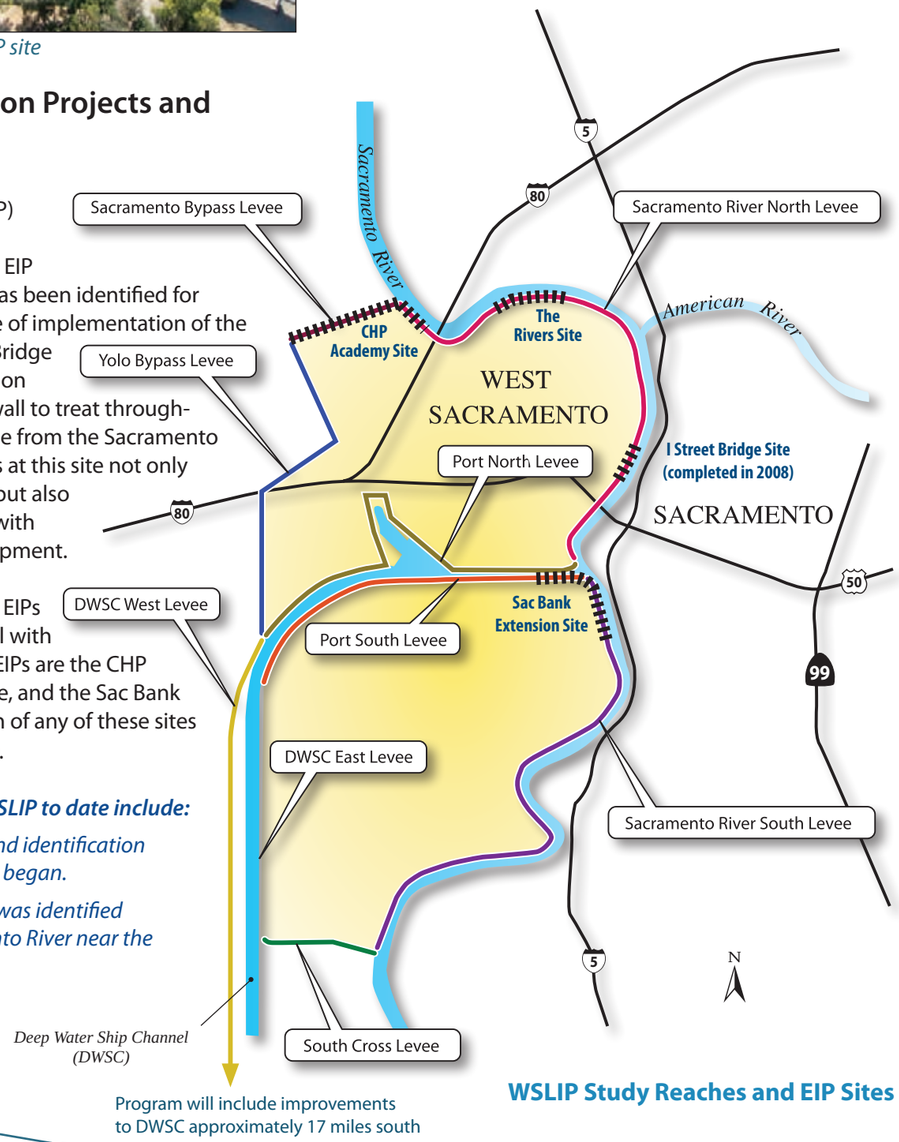
Completed I Street Bridge EIP site

Early Implementation Projects and Progress to Date

The I Street Bridge Early Implementation Project (EIP) was the first construction milestone for the WSLIP. An EIP is a critical repair site that has been identified for implementation in advance of implementation of the overall WSLIP. The I Street Bridge EIP resulted in the completion of 475 linear feet of slurry wall to treat through-seepage and under-seepage from the Sacramento River. Completion of repairs at this site not only increases flood protection but also allows the City to proceed with plans for waterfront development. The I Street Bridge EIP was completed in 2008. Three new EIPs are being evaluated parallel with the WSLIP. These potential EIPs are the CHP Academy site, the Rivers site, and the Sac Bank Extension site. Construction of any of these sites would not begin until 2010.

Accomplishments under WSLIP to date include:

2006 *WSLIP evaluation and identification of levee deficiencies began.*



2007 *A critical repair site was identified along the Sacramento River near the I Street Bridge.*

The WSLIP team began analyzing the different potential improvements (alternatives) to alleviate the levee deficiencies within the study area.

2008 *In April, a draft Problem Identification Report outlining the initial conclusions of the levee evaluation was completed.*

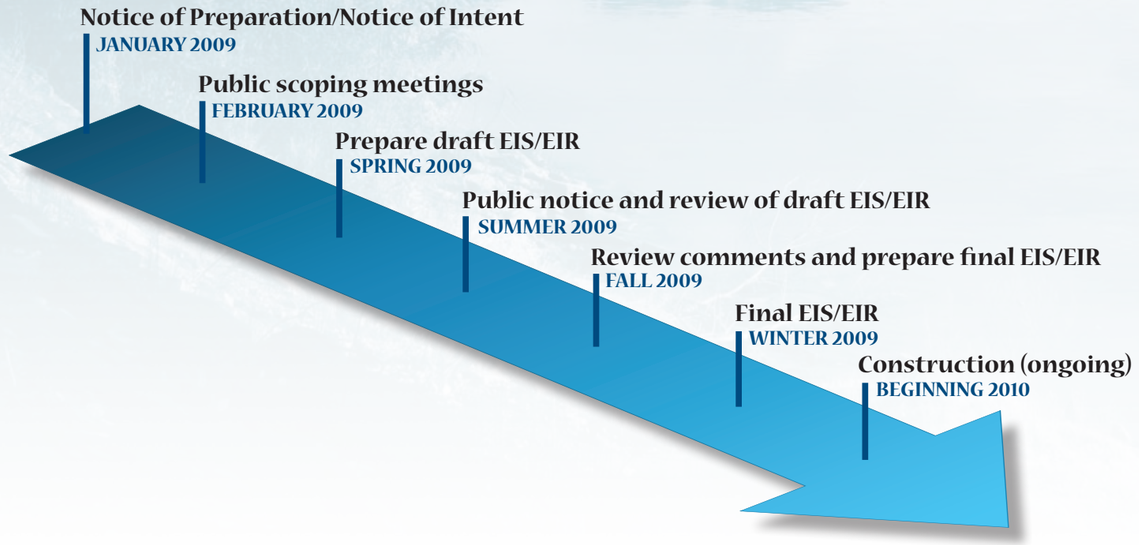
The I Street Bridge EIP was completed in late summer 2008.

USACE joined the WSLIP as the federal lead agency for purposes of complying with the National Environmental Policy Act (NEPA).

WSLIP Study Reaches and EIP Sites

Partnerships for Flood Protection

About WSAFCA, USACE, and DWR



WSAFCA , USACE, and the California Department of Water Resources (DWR) are working collaboratively to improve flood protection for West Sacramento. WSAFCA is a joint powers authority formed in 1994 to coordinate the planning and construction of flood protection facilities and to finance the local share of flood control projects. Its member agencies are the City of West Sacramento and Reclamation Districts 900 and 537. DWR manages the water resources of California with a goal of protecting lives and infrastructure from flood risk as well as meeting water supply needs. USACE provides engineering services to the nation by designing, building, and operating water resource projects, including flood control projects on the Sacramento River. It is also charged with oversight of modification to federal levees and protection of resources under the Clean Water Act.

Environmental Analysis

An Environmental Impact Statement (EIS) and an Environmental Impact Report (EIR) are documents that are required to comply with the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA), respectively. The purpose of these documents is to analyze and disclose a project's potential effects on the natural and human environment and identify mitigation measures and alternatives to avoid significant effects.

WSAFCA started preparing an EIR for the WSLIP in 2006 to comply with CEQA regulations. In 2008, USACE joined the WSLIP team as the federal lead and an EIS will also be prepared to fulfill federal requirements under NEPA. The document will be prepared as a "joint" EIS/EIR. A draft EIS/EIR is scheduled to be available for comment in summer 2009.

WSLIP Estimated Timeline for NEPA/CEQA Process

Subject: Notice of Preparation of a Draft Environmental Impact Statement/Environmental Impact Report (DEIS/DEIR) for West Sacramento Levee Improvements Program Project (WSLIP).

Dear Mr. Powderly:

Staff of the California State Lands Commission (CSLC) has received the above referenced Notice of Preparation of a Draft Environmental Impact Statement/Environmental Impact Report (DEIS/DEIR) for West Sacramento Levee Improvements Program Project (WSLIP). Under the California Environmental Quality Act (CEQA), the CSLC is a Responsible and/or Trustee Agencies for any and all projects which could directly or indirectly affect sovereign lands, their accompanying Public Trust resources or uses, and the public easement in navigable waters

The State acquired sovereign ownership of all tidelands and submerged lands and beds of navigable waterways upon its admission to the United States in 1850. The State holds these lands for the benefit of all the people of the State for statewide Public Trust purposes which include waterborne commerce, navigation, fisheries, water-related recreation, habitat preservation, and open space. The landward boundaries of the State's sovereign interests in areas that are subject to tidal action are generally based upon the ordinary high water marks of these waterways as they last naturally existed. In non-tidal navigable waterways, the State holds a fee ownership in the bed of the waterway between the two ordinary low water marks as they last naturally existed The entire non-tidal navigable waterway between the ordinary high water marks is subject to the Public Trust Easement. Both the easement and fee-owned lands are under the jurisdiction of the CSLC. The locations of the ordinary high and low water marks are often related to the last natural conditions of the river, and may not be apparent from a present day site inspection

The Sacramento Bank Extension Site and the Rivers Site are located in the Sacramento River, which is State-owned sovereign lands owned in fee by the State; therefore, a lease from the CSLC will be required. To the extent there are State-owned

sovereign lands at the California Highway Patrol Academy Site, a lease will also be required; however, a detailed site location will need to be submitted to the CSLC to determine the exact extent of the CSLC's leasing jurisdiction.

The current project is to address improving up to 50 miles of federal flood protection levees surrounding West Sacramento. The improvements will increase the level of flood protection to achieve a minimum of 200-year flood protection Improvements to the levee system will result in disturbance and the potential loss of riparian habitat along sections of the proposed project. These changes, along with those proposed for the other levee system enhancements in the Sacramento Valley, will result in a cumulative loss of riparian vegetation and shaded riverine aquatic habitat along the river bank, which will be difficult to mitigate and may result in secondary impacts to the listed runs of salmonids and listed avian species. The CSLC recommends that the West Sacramento Area Flood Control Agency (WSAFCA) work very closely with the fisheries agencies (i.e., California Department of Fish and Game (CDFG), U.S. Fish and Wildlife Service (USFWS), and NOAA Fisheries) and with local representatives of adjoining landowners (such as the Sacramento River Conservation Area Forum) to addresses these cumulative impacts and to design appropriate mitigation/conservation areas. Other types of mitigation, such as avoidance, both in time and space (such as construction work windows), will also need to be considered.

Queries of the Natural Diversity Database (CNDDB) and the USFWS Special Status Species Database should be conducted to identify any special-status plant or wildlife species that may occur in the region. Their potential for occurrence on the project site or in the project area should be included in the DEIS/ DEIR.

One of the major stressors of the Sacramento River system is introduced species. Therefore, the DEIS/DEIR should consider a range of alternatives for prevention programs for terrestrial and aquatic invasive species (including quarantine, early detection, and early response) to slow the introduction of invasive species, such as the Quagga mussel, into high demand and sensitive areas. As part of the alternative analysis, the design of the proposed project should take into consideration the current and proposed aquatic invasive species prevention programs. In addition, in light of the recent decline of pelagic organisms and in order to protect at-risk fish species, the DEIR/DEIS should examine the objectives of the project and determine if the project would favor non-native fisheries within the Sacramento River

An evaluation of the noise and vibration impacts on fish and birds from construction activities in the water, as well as construction on the levees and land-side supporting structures of the Sacramento River and flood control facilities, should be included in the DEIS/DEIR. Mitigation measures may be needed that would include species-specific work windows as defined by CDFG, USFWS, and NOAA Fisheries.

The Central Valley Flood Protection Board (CVFPB) encroachment permit may be required as well as a geotechnical evaluation of the proposed project locations. Placing rock riprap within the channels of the Sacramento River channel will require

to alter Federal flood protection levees (33 USC 408) Additional coordination with the CVFPB and the US ACE may include working within the established flood season windows

Any construction activities along the water-side bank should consider water quality issues, such as increased turbidity and sedimentation, and make all the necessary arrangements to reduce or mitigate for these concerns.

An evaluation of potential submerged cultural resources in the project area will need to be undertaken. Any submerged archaeological site or submerged historic resource remaining in state waters for more than 50 years is presumed to be significant. The title to all abandoned shipwrecks and all archaeological sites and historic or cultural resources on or in the tide and submerged lands of California is vested in the state and under the jurisdiction of the CSLC. The CSLC maintains a shipwrecks database of known and potential vessels located on the state's tide and submerged lands, however, the location of many shipwrecks remains unknown. The recovery of objects from any submerged archaeological site or shipwreck requires a salvage permit under Public Resources Code (PRC) section 6309 On statutorily granted tide and submerged lands, a permit may be issued only after consultation with the local grantee and a determination by the CSLC that the proposed salvage operation is not inconsistent with the purposes of the legislative grant. A Code of Federal Regulations section 106 evaluation should be made, as well, to determine any potential terrestrial cultural resources in the project areas where construction can occur

Greenhouse gas emissions information consistent with the California Global Warming Solutions Act (AB 32) should be included in the DEIS/DEIR. This would include a determination of the greenhouse gases that will be emitted as a result of construction and ongoing maintenance of the levee system, a determination of the significance of those impacts, and mitigation measures to reduce any impacts found to be significant

An evaluation of the temporary and permanent loss of recreation resources in the specific areas during the construction of the Sacramento River levee and flood control facilities improvements should be included in the DEIS/DEIR. These impacts should include mitigation measures, which might include alternative public access points, for the residents and tourists for the area

The DEIS/DEIR should discuss the potential changes and impacts to current transportation routes into and out of areas during the construction of the proposed Sacramento River levee improvements and flood control facilities. Once again, these impacts should include mitigation measures for the residents and tourists of the area.

As a responsible agency, the CSLC will need to rely on this document for the issuance of a lease, and therefore, we hope that you consider our comments prior to adoption of the final EIS/EIR. Please contact Diane Jones, Public Land Manager, at 916-574-1843 or by email at jonesd@slc.ca.gov for information about our leasing

requirements For questions and comments related to the environmental review, please contact Christopher Huitt at (916) 574-1938 or by e-mail at huittc@slc.ca.gov
If you have any questions involving the Shipwreck and Historic Maritime Resources Program please contact Staff Counsel Pam Griggs at (916) 574-1854 or by email at griggsp@slc.ca.gov.

Sincerely,

Gail Newton, Chief
Division of Environmental Planning

Subject: Comments on Proposed EIR

John, I received the notice and the only comment I have at this point (from Public Works perspective) is to request that particular attention be given to the CHP Academy site as a portion of that EIP area encompasses piping, structures and equipment for the water treatment plant and the City's potable water supply. That's it for now. Thanks.

File No.: 091.A11529 West Sac levee repair

John Powderly
West Sacramento Area Flood Control Agency
1110 West Capitol Avenue, Second Floor
West Sacramento, CA 95691

Dear Mr. Powderly:

The California Highway Patrol Office of the Academy (Academy) is encouraged to see that the City of West Sacramento has moved to make necessary repairs to its levee system, thereby increasing the security and safety of the Academy's borders.

The repair work of our northern levee (Sacramento Bypass Levee) and the Sacramento River West/North Levee should have no significant impact on daily Academy operations. Both levee sections are no closer than one-third of a mile to the nearest dormitory room, so construction noise should not be an issue. Levee repair personnel can access both levees by way of Harbor Boulevard and River Road. Should it become necessary for repair personnel to gain access via Academy property, our staff will assist them in order to avoid disrupting cadet training.

If you need to contact the Academy, feel free to call (916) 376-3200. If it is an emergency, please call the Academy Staff Office at (916) 376-3315.

I wish you great success in your endeavor

Sincerely,

D. B. NEWMAN, Captain
Commander
Office of the Academy

My Comments

The Old River Road 22 from West Sacramento to Woodland (which passes over the Weir and is also a levee) according to a man from RD537 is not in good shape because of the semi trucks that are using this road as a cut through from I-5 to West Sacramento or vice versa to save driving three miles. When RD537 ends, RD1600 begins. Supposedly where the County maintains the road/levee; this road/levee isn't maintained as well as it has been in the past.

The statement about the non-compliant vegetation: If humans didn't interfere with levees—that non-compliant vegetation would not be an issue.

A lot of the areas (known as flood plains where farmers planted) the water naturally flowed into have been changed or eliminated (built on); so where is the water supposed to go?

The Rivers site: I thought that this levee had been repaired after the levee was compromised from building on it. Now I learn in this session that there is water bubbling (a boil perhaps) that this City has kept under wraps (in my opinion) from the community outside of the Rivers development. After asking more questions about further building on this site—I learn that there were already permits issued and (apparently no conditions on these permits such as a compromised or deteriorating levee) the City would have to pay for each permit if the City chooses not to allow the building to happen. I am demanding that we have such a condition in place that should any levee not meet the standard to be built on or near, the permit can be revoked at that time without any penalty or payment by the City. They are taking a chance and it should be noted with a big red stamp that says so. We should not have to compromise a levee for developers wants. People are more important than money. What guarantee is there going to be that the levee **will** be fixed? We thought the levee was fixed before.

It's not addressed in here, but how much damage to the environment and the river are the homeless camps creating? They are attracting rodents. The hazardous waste (various types) they leave behind!!!

I want our furry creatures left alone since they have nowhere else to go. I refer to coyotes, raccoons, rabbits, and the like.

How much damage do all the boats do as they are zooming up and down the river?

The CHP Academy site: Hasn't this site been fixed many times before? Why is there still a problem?

CECW-CE

Technical Letter
No. 1110-2-571

10 April 2009

EXPIRES 10 April 2014

Engineering and Design

GUIDELINES FOR LANDSCAPE PLANTING AND VEGETATION MANAGEMENT AT LEVEES, FLOODWALLS, EMBANKMENT DAMS, AND APPURTENANT STRUCTURES

1. Purpose. This ETL provides guidelines to assure that landscape planting and vegetation management provide aesthetic and environmental benefits without compromising the reliability of levees, floodwalls, embankment dams, and appurtenant structures. It is important to note that all minimum guidelines presented herein are just that—minimums. The dimensions of the vegetation-free and root-free zones defined in this document provide the minimum acceptable buffer between vegetation and flood damage reduction structures. For each individual project, the design team must consider whether or not these minimums are adequate to the specific needs and conditions of the project.

2. Applicability. This ETL applies to all USACE Commands having Civil Works responsibilities and to all flood damage reduction projects for which USACE has responsibility for design, operation, maintenance, inspection, or certification. Applicability to non-federal projects is as follows: under the Rehabilitation and Inspection Program (RIP), the USACE performs inspections of non-federal projects (i.e. projects built by local communities then incorporated into the RIP) under ER 500-1-1 and the provisions of Public Law 84-99.

3. Distribution. Approved for public release, distribution is unlimited.

4. General. Levees, floodwalls, embankment dams, and their appurtenant structures serve a common purpose in that they are designed to contain water and prevent flooding for varying lengths of time. They must also be readily accessible by equipment and personnel essential to reliable operation and maintenance. The possibility for long-term saturation of levee materials or levee and floodwall foundations, together with their specific operation and maintenance requirements, makes it necessary to exercise caution in the design of landscape planting and

---

This ETL supersedes:

EM 1110-2-301, *Guidelines for Landscape Planting and Vegetation Management at Floodwalls, Levees, and Embankment Dams*, 1 January 2000.

Memorandum, Headquarters, United States Army Corps of Engineers (HQUSACE) (CECW-HS), MG Don T. Riley, Subject: Interim Vegetation Guidance for Control of Vegetation on Levees, 12 June 2007.

vegetation management at these structures. This ETL describes important characteristics of levees, floodwalls, embankment dams, and their appurtenant structures.

5. Future Guidance. Planned research is intended to complement this guidance: future editions will include field studies of vegetation impacts to flood damage reduction structures and helpful information on the root system characteristics of various plant species.

CHAPTER 1
INTRODUCTION

1-1. Purpose. This ETL provides guidelines to assure that landscape planting and vegetation management provide aesthetic and environmental benefits without compromising the reliability of levees, floodwalls, embankment dams, and appurtenant structures. It is intended as a guide for safe design and not as a restriction to the initiative of designers. These guidelines should be used with reasonable judgment and practicality, tailored to the specific requirements and conditions of each individual project. The integrated design of landscape plantings and vegetation management at flood damage reduction systems requires a coordinated, interdisciplinary effort involving the local sponsor and the following disciplines: civil engineer, landscape architect, levee and/or dam safety engineer, environmental engineer, geologist, biologist, and additional related disciplines, as appropriate.

1-3. Policy.

a. Where the safety of the structure is not compromised, and effective surveillance, monitoring, inspection, maintenance, and flood-fighting of the facility are not adversely impacted, appropriate landscape planting (trees, shrubs, vines, forbs, and grasses) may be incorporated into the design of all flood damage reduction projects, subject to the limitations set forth in this document. Because landscape plantings enhance the environment, with respect to both natural systems and human use, they are to be considered in all flood damage reduction project planning and design studies and will be fully presented in design documentation reports. For projects in which the maintenance of the completed facility will be the responsibility of the local sponsor, the landscape planting will be fully coordinated with the local sponsor during planning and design to determine the sponsor's desires and to obtain assurances that the sponsor is capable of, and committed to, the proper maintenance of the vegetation.

b. In certain instances, to further enhance environmental values or to meet state or federal laws and/or regulations, the local sponsor may request a variance from the standard vegetation guidelines set forth in this ETL. Vegetation variances for either federal or non-federal flood damage reduction systems may be permitted. The vegetation variance must meet the following two criteria:

(1) The variance must be shown to be necessary, and the only feasible means, to (a) preserve, protect, and enhance natural resources and/or (b) protect the rights of Native Americans, pursuant to treaty and statute.

(2) With regard to flood damage reduction systems, the variance must assure that (a) safety, structural integrity, and functionality are retained, and (b) accessibility for maintenance, inspection, monitoring, and flood-fighting are retained. Note that, as used here, the term "retained" assumes a pre-variance condition that is fully consistent with the requirements set forth in this ETL, and any other applicable criteria.

Periodic clearing of some types of vegetation, both woody (trees, shrubs, and vines) and non-woody (grasses and forbs), will be performed, as needed, to maintain the conditions described in the second criterion. The variance will not be a substitute for poor maintenance practices. See the following references regarding variances to levee vegetation standards: ER 500-1-1, for policy; EP 500-1-1, for the request and approval process; and, any other applicable guidance issued subsequent to this document.

c. Any addition of landscape plantings to existing flood damage reduction systems must comply with the project's O&M manual. New plantings may not be approved without an appropriately detailed and documented engineering evaluation to ensure that design intent and safety criteria are maintained as originally authorized.

1-4. Environmental Quality and Aesthetics. Environmental quality and aesthetics are of special concern. The design and maintenance of flood damage reduction systems must fully consider the environmental implications of the proposed actions and ensure that they are

consistent with the doctrine outlined in the Corps' Environmental Operating Principles. Project design should respond appropriately to the visual character of the project context with respect to the characteristics of both the natural and built landscapes. Landscape planting design should consider both human use and the environmental processes and characteristics of the entire area influenced by the project. While it is seldom feasible to preserve the natural setting intact, design techniques and careful construction methods can protect and perhaps enhance local environmental and aesthetic values.

CHAPTER 2
LANDSCAPE PLANTING: OBJECTIVES AND ENGINEERING REQUIREMENTS

2-1. Background. In flood damage reduction projects, the goal of landscape planting is to minimize and/or mitigate negative impacts to aesthetic, environmental, and ecological conditions, such that post-project conditions are equal to, or better than, pre-project conditions. Landscape planting objectives include the following: provide cover to prevent dust and erosion; provide ecological benefits, such as improved water quality and wildlife habitat; integrate the flood damage reduction system with the surrounding natural and human environment; separate activities; define zones of use; provide privacy; screen undesirable features or views; accentuate positive features or views; and create a pleasant environment for human use and recreation. These and any other project-specific landscape planting objectives must be consistent with both the policy set forth in Paragraph 1-3 and the engineering requirements detailed in this chapter.

2-2. Vegetation-Free Zone.

a. The vegetation-free zone is a three-dimensional corridor surrounding all levees, floodwalls, embankment dams, and critical appurtenant structures in all flood damage reduction systems. The vegetation-free zone applies to all vegetation except grass. Grass species are permitted, as described in Paragraph 4-8, for the purpose of erosion control.

b. The primary purpose of the vegetation-free zone is to provide a reliable corridor of access to, and along, levees, floodwalls, embankment dams, and appurtenant structures. This corridor must be free of obstructions to assure adequate access by personnel and equipment for surveillance, inspection, maintenance, monitoring, and flood-fighting. In the case of flood-fighting, this access corridor must also provide the unobstructed space needed for the construction of temporary flood-control structures. Access is typically by four-wheel-drive vehicle, but for some purposes, such as maintenance and flood-fighting, access is required for larger equipment, such as tractors, bulldozers, dump trucks, and helicopters. Accessibility is essential to the reliability of flood damage reduction systems.

c. The vegetation-free zone must be wide enough, and tall enough, to accommodate all likely access requirements. The minimum allowable vegetation-free zone dimensions are based on lessons learned from flood-fighting experience and are illustrated in Chapter 6, for a variety of flood damage reduction system configurations. The general rule is as follows:

(1) The minimum height of the corridor shall be 8 feet, measured vertically from any point on the ground.

(2) The minimum width of the corridor shall be the width of the levee, floodwall, or embankment dam, including all critical appurtenant structures, plus 15 feet on each side, measured from the outer edge of the outermost critical structure. In the case of a planting berm (Figures 13, 14, and 15), the 15 feet is measured from the point at which the top surface of the planting berm meets the levee section.

(3) No vegetation, other than approved grasses, may penetrate the vegetation-free zone, with two exceptions, as illustrated in Figure 2:

(a) Tree trunks are measured to their centerline, so one half of the tree trunk may be within the vegetation-free zone.

(b) Newly planted trees, whose crowns can be expected to grow, or be pruned, clear of the vegetation-free zone within 10 years.

d. The minimum vegetation-free zone dimensions may not be diminished without a formal variance (see Paragraph 1-3*b*). Due to specific site conditions and project requirements, many levees, floodwalls, embankment dams, and appurtenant structures will be determined, by the project design team, to require a vegetation-free zone larger than the minimum described here.

e. Paragraph 2-2 has established the minimum acceptable width of the vegetation-free zone at 15 feet. Other than by variance, as described above, the single exception to this 15-foot minimum requirement arises in the case of an existing project where the width of the existing real estate interest for the project is less than 15 feet. In such a case, the vegetation-free zone width shall be the maximum attainable within the existing real estate interest.

2-3. Vegetation-Management Zone. A recommended alternative to enlarging the vegetation-free zone is the addition of an adjacent *vegetation-management zone* (see Figure 22). A vegetation-management zone provides greater opportunity to include vegetation by reserving the option to manage it selectively, as needed. Two of many possible scenarios are presented below.

a. Several trees, just outside the vegetation-free zone, are inhibiting grass growth, through light deprivation and/or the production of their own natural herbicides that limit competition for moisture and nutrients. These trees should be either removed or modified, as appropriate, to assure that grasses thrive and continue to provide effective erosion control.

b. A large tree, outside the vegetation-free zone, becomes a *hazard tree* when its root system is severely damaged by construction activity, thereby increasing its susceptibility to windthrow and the associated risk of damage to a floodwall. This tree should be removed.

2-4. Root Impacts. As stated in Paragraph 2-2, the primary purpose of the vegetation-free zone is access. However, it also serves a secondary purpose: it provides distance between root systems and levees, floodwalls, embankment dams, and appurtenant structures, thereby moderating reliability risks associated with the following two situations: potential piping and seepage due to root penetration; and structural damage (a hole in the ground, surrounded by an area of disturbed earth) resulting from a wind-driven tree overturning. Though not adequate for all situations, this 15-foot zone does provide a measure of risk reduction, as follows:

a. Root size and numbers diminish with distance from the tree trunk.

b. The hole and its surrounding area of disturbed earth, created by a tree overturning, typically has a radius ranging from 6 to 12 feet. This secondary effect of the vegetation-free

zone is important to the reliability of flood damage reduction systems; it is not a root-free zone but it is a zone of reduced root impact.

2-5. Root-Free Zone. Planting design must consider the possible implications to foundation strength and performance. The integrity of the foundation could be compromised if potential seepage paths were created by root penetration and/or root decay. The root-free zone provides a margin of safety between the greatest expected extent of plant roots and the beginning face of any structure that is critical to the performance and reliability of the flood damage reduction system. The list of such structures includes levees, floodwalls, embankment dams, seepage berms, seepage drains, toe drains, pressure relief wells, and cut-off trenches. These critical structures must be root-free, as illustrated in Figures 13, 14, 15, 17, and 19. The rooting habit of each plant selected for use near a root-free zone must be predictably understood with respect to its potential to invade the root-free zone and compromise the reliability of the flood damage reduction system. Landscape planting plans will reflect full recognition of the importance of selecting appropriate plant species and varieties. Root barriers may be used to provide an added measure of assurance, but they should not be a substitute for adequate distance between plantings and root-free zones. Root barriers shall not retard groundwater or seepage flow. Some root barriers include herbicides to enhance effectiveness; in every case, these shall be evaluated prior to use to assure against negative environmental impacts.

2-6. Water-Current and Wave-Action Barrier. The use of suitable vegetation, such as shrub forms of *Salix* (willow), riverward of the vegetation-free zone is encouraged as an environmentally beneficial means to moderate the erosive potential of water currents and wave action.

CHAPTER 3
TREATMENT OF LEVEES, FLOODWALLS, EMBANKMENT DAMS, AND APPURTENANT STRUCTURES

3-1. General.

a. The integrity of levees, floodwalls, embankment dams, and appurtenant structures is paramount to the public health, safety, and welfare. The presence of undesirable vegetation can undermine that integrity and lead to failure if not corrected.

b. Trees and other woody vegetation, such as shrubs and vines, can create both structural and seepage instabilities, prevent adequate inspection, and create obstacles to maintenance and flood-fighting/flood-control activities. Vegetation must be controlled for the following reasons:

(1) To allow proper inspection, surveillance, and monitoring of all structures and adjacent areas for seepage, cracking, sinkholes, settlement, displacement, and other signs of distress.

(2) To allow access for normal and emergency Operations and Maintenance activities.

(3) To prevent root-related damage to structures, such as shortened seepage paths through embankments and/or foundations; voids in embankments and/or foundations due to decayed roots or fallen trees; clogged seepage collector systems; and expansion of cracks or joints in concrete walls, spillway floors, and canal linings.

(4) To limit those habitat characteristics that encourage the creation of animal burrows.

(5) To allow full design-discharge capability of waterways, spillway inlet and outlet channels, outlet-works discharge channels, and other open conveyance channels.

(6) To avoid any incidental growth and subsequent presence of endangered species that might prohibit activities necessary for operations, maintenance, or access.

c. This document establishes minimum dimensions for both vegetation-free zones and root-free zones; however, for any specific project, those minimum dimensions may be increased by levee and/or dam-safety engineering personnel due to site-specific considerations such as topography, phreatic surfaces within the structure and abutments, geological features, historical embankment and/or foundation seepage or issues, stability issues, and foundation characteristics.

3-2. Levees.

a. Levees are usually constructed of compacted earth fill. In some cases, internal drainage or under-seepage treatment is incorporated into the levee. When a planting berm is used to allow vegetation nearer to the levee centerline, the internal blanket drain and/or toe drain must be extended, as shown in Figures 14 and 15. Any such extension must be assessed by the design team for impact to the seepage control system.

b. All levees must have effective and reliable erosion protection; the appropriate use of grasses is described in Paragraph 4-8. Where opportunities exist, environmental improvements should be considered. Project design shall address the following criteria:

(1) Urban levees. Because levee projects have the potential to dominate these high-visibility landscapes, planting is often desirable, particularly in high-visibility locations, such as at and along major thoroughfares, parks, and waterfront developments.

(2) Rural or agricultural levees. Although these are typically not high-visibility areas, both human use and environmental needs should be considered during design. Plantings are particularly appropriate for the following areas, provided they are consistent with site-specific engineering requirements: high-visibility pumping installations, public road crossings, near residences, and at other project locations where landscape plantings could protect or restore valued environmental characteristics.

c. Minimum vegetation-free and minimum root-free zones are established for levees, as illustrated in Chapter 6.

3-3. Floodwalls.

a. Floodwalls are most often used in urban areas, where land or access is constrained. These walls are subject to hydraulic forces on one side, which may be resisted by little or no earth-loading forces on the other side. Landscape planting should be addressed in floodwall design, particularly where walls encroach on, or change, existing scenic values, e.g., where the wall becomes a visual barrier along a street or near dwellings, parks, and existing or anticipated commercial developments.

b. The minimum vegetation-free zone provides for access, but there are two additional areas of concern with respect to floodwalls.

(1) Large trees can be a threat to project reliability. Planting design and maintenance must take into account the potential for overturning trees to damage floodwalls. The following factors can be used, alone or in combination, to limit potential for such damage:

(a) Distance between a tree and the wall.

(b) Tree species selection, favoring trees with a low potential for breaking and overturning.

(c) Tree monitoring and maintenance to address hazard trees.

(d) Intervening obstacles, such as other trees, that would reliably restrain a falling tree. Where other factors are unreliable, the distance between a tree and the wall must be adequate: e.g. a minimum distance of one-half of the mature tree height.

(2) Planting design and maintenance must also take into account the three potential means by which tree roots may damage floodwalls:

(a) Large tree roots can damage concrete structures by jacking (lifting) them, which can cause cracking and separation at joints. Further, if a floodwall is lifted, a seepage path could form along the structure/foundation contact. Smaller (lighter) floodwalls are more susceptible than larger (heavier) structures.

(b) Roots may also grow into and through wall joints, loosening and eroding wall-joint seals, thus damaging the water-proof characteristics.

(c) A floodwall may have a toe drainage system to check and control piping and boils; to control seepage that may result from roofing, where piles are used; and to control uplift pressures. These drainage systems must be protected from invasion by roots, which could clog them.

c. Although there are several types of floodwalls, the two most common are the inverted-T type reinforced concrete wall and the cantilever-I type sheet piling wall. The vegetation impact concerns are similar for both types. For all the reasons cited above, minimum vegetation-free and minimum root-free zones are established for floodwalls, as illustrated in Figures 16–19.

3-4. Embankment Dams and Appurtenant Structures.

a. Purpose. "Tree and woody-vegetation penetrations of earthen dams and their appurtenances have been demonstrated to cause serious structural deterioration and distress that can result in failure of earthen dams" (Association of State Dam Safety Officials 2002). Proper establishment and control of vegetation is critical to dam safety. This Paragraph establishes minimum requirements for landscape planting and vegetation management at embankment dams (earth fill, rock fill, or earth and rock fill), including multipurpose projects with both concrete and embankment dam structures (wing dams) and perimeter saddle dams (dikes); abutments; and appurtenances, such as spillways, outlet works, and inlet and/or outlet channels.

b. Policy. The following five areas are vegetation-free zones:

(1) The dam or the dam-toe area.

(2) In or around seepage monitoring systems or critical downstream areas where seepage observation must be vigilant and continuous.

(3) Groin abutments and areas immediately adjacent.

(4) Spillways and spillway channels, including spillway slopes and approaches to spillways where vegetation could, in any way, impede the efficient operation of the spillway.

(5) The outlet-works discharge channel.

c. Vegetation-Free Zones. Vegetation-free zones shall, when dry, be mowed to a height of 3–6 inches at any time the grass reaches a height of 12 inches. Mowing shall be triggered by grass heights of less than 12 inches if important to the health maintenance of the particular grass

species. The maximum height of grasses shall be 12 inches. The minimum vegetation-free zone requirements for specific structures are described below.

(1) Embankment Dams. At a minimum, for "dry" reservoirs, the entire dam embankment surface, including upstream impervious blankets and the upstream and downstream areas within 50 feet of the embankment toe, shall be a vegetation-free zone (see Figure 20). For "normal pool" conditions, the entire embankment surface from the upstream toe of the dam or from the upstream limit of the impervious blanket, as applicable, to a minimum distance of 50 feet from the downstream toe shall be a vegetation-free zone (see Figure 21).

(2) Dam Abutments. The dam abutment is defined as the part of a natural valley side-wall against which a dam is constructed. At a minimum, the vegetation-free zone shall extend for a horizontal distance of 15 feet beyond the embankment/abutment contact line (i.e. groin).

(3) Spillways. The safety of embankment dams requires the unobstructed operation of spillways. The minimum vegetation-free zone shall include the spillways and spillway channels, including spillway slopes and approaches.

(4) Outlet-Works Discharge Channels. The minimum vegetation-free zone shall include the entire outlet channel, outlet structure headwalls and wingwalls, and surrounding areas to a distance of 50 feet from the top of the bank of the outlet channel.

CHAPTER 4
DESIGN CONSIDERATIONS

4-1. Feasibility Analysis. During design, an analysis shall be made of the flood damage reduction system to determine if and where landscape planting can be permitted. Not all projects will have a satisfactory combination of conditions to permit planting of trees, shrubs, vines, forbs, and grasses. In some cases, only shrub planting may be feasible, while in other cases planting may be limited to grasses. Site conditions, engineering design criteria, and operation and maintenance requirements should determine the appropriate planting scheme. However, environmental objectives shall be considered in all projects, and the engineering design should seek to accommodate appropriate plantings. Some important site considerations are described below.

a. Types of Construction Material. The type of construction material is an important factor in determining suitability for landscape planting. Rock, sand, and many types of compacted clay embankments are examples of poor plant-growing media. The roots of some plant species, under some conditions, may penetrate a great distance into a sand levee, potentially providing a path for piping through the structure. Plants must be selected very carefully with regard to the type of construction materials used to ensure survival of the plant and prevent damage to the structure.

b. Project Alignment. Project alignment can be a complex exercise involving multiple, often conflicting criteria and requiring a coordinated effort by the project delivery team. The role of the landscape architect is to identify opportunities and constraints to human use relative to project alignment. For example, in an urban area, a relatively minor adjustment to a proposed alignment might allow for plant screening between residences and the structure or provide space for a park or other community green space. Often, those segments of the alignment that are otherwise arbitrary may be turned to advantage with respect to human use.

c. Environmental Factors. The types of vegetation suited to a site are a function of a number of environmental factors. Local climate (precipitation, temperature, dates of earliest and last frost, etc.) can limit the types of vegetation that survive in a particular region. Soil type, pH, nutrient character, exposure to sunlight, flood and drought duration, and depth to groundwater are additional conditions that can influence the potential for a site to support vegetation. Because one important functional characteristic of vegetative groundcovers is the ability to provide erosion control, it is necessary to confirm that the proposed cover can withstand the energy environment under flood conditions. This may require an assessment of local velocities and shear stresses and comparison of predicted values under flood conditions against thresholds for various types of vegetation.

4-2. Planting Berms.

a. Beyond the minimum section needed to satisfy stability requirements, it is sometimes desirable to add additional earth fill to a levee or embankment dam to create a planting berm, in order to better accommodate differing types of public use and related landscape planting approaches (see Figures 13, 14, and 15). The appropriate dimensions of the planting berm

should be determined by the landscape architect in consultation with the design team. Additional rights-of-way may be necessary to accommodate the additional fill material and flatter slopes. Except in approved planters, vegetation is not permitted on any overbuild that has a system-reliability function. Planting berms may be considered for use on the land side only.

b. Planting layout and plant material characteristics shall be coordinated with the design team to assure adequate access between the levee crown and the toe for two purposes: visual access is required for inspection of the toe area; and physical access is required for flood-fighting activities involving personnel and heavy equipment. In all cases, the planting berm must be of sufficient depth to accommodate any proposed vegetation while precluding root penetration into any root-free zone. Design must include adequate consideration of any internal drainage or seepage control system (see Figures 14 and 15).

c. Additional design requirements for planting berms include the following. For new projects, engineering and design shall be in accordance with ER 1110-2-1150, *Engineering and Design for Civil Works Projects*, and all related guidance. For existing projects, engineering and design shall be in accordance with CECW-PB memorandum dated 23 Oct 2006, *Policy and Procedural Guidance for the Approval of Modification and Alteration of Corps of Engineers Projects*.

4-3. Planters.

a. In overbuild areas, permanent plant containers, such as concrete planters, may be considered. Planters must not impact the designed dam or levee section, or appurtenant structures, such as berms, drains, ditches and wells. Planter design and layout must allow for adequate access up and down the embankment as required for inspection and flood-fighting activities and must be approved by the Dam or Levee Safety Officer.

b. Planters and containerized plants should be used selectively and should be considered only when normal planting is not practical. The initial cost and the ability of the sponsor to maintain this type of planting should be considered during design. Plants selected for use in planters should have mature heights of not more than approximately 20 feet.

4-4. Irrigation Systems. Irrigation systems within the vegetation-free zone pose two potential threats to system reliability: pressurized waterlines may fail, resulting in damage to the engineered embankment section; and irrigation water may impair visual inspection by obscuring wet areas that are actually due to seepage. Any irrigation system that targets the vegetation-free zone shall be engineered so as to address these issues and meet the approval of the District dam or levee safety officer. Designs may include features such as double-walled piping and leakage detection systems.

4-5. Flood-Fighting and Structure Maintenance. Flood-fighting and maintenance operations for levees, floodwalls, embankment dams, and appurtenant structures can be complex. These operations must not be impacted by the layout and physical characteristics of landscape plantings. Landscape plantings will be designed to permit inspection of structures from moving vehicles. Access requirements for emergency repair and replacement associated with flood-fighting efforts shall also be considered.

4-6. Maintenance of Plantings. Planting designs must be consistent with the capacity of the project sponsor to maintain them. Maintenance shall include the control and/or removal of invasive species. Low-maintenance plant materials are often the most appropriate choice.

4-7. Selection of Plant Material. Plants will be selected from approved plant lists prepared jointly by Division and District landscape architects in conjunction with the local sponsor or resource agencies. The list will include trees, shrubs, vines, forbs, sedges, and grasses that are native to the region and well adapted to the climactic, soil, and hydrologic conditions of the site. Plant lists should be appropriate to the specific structural conditions and requirements of each project. As the project site experiences fluctuations in various environmental conditions over time, such as water level, precipitation, and herbivory, some plants or species will not survive but others may thrive. A diverse array of plant species is essential to a riparian system's resiliency and its ability to provide and sustain a number of functions. A botanist familiar with local flora should be enlisted to select those species from the approved list most likely to meet project objectives.

4-8. Appropriate Ground Cover in the Vegetation-Free Zone.

a. The only acceptable vegetative ground cover in the vegetation-free zone shall be perennial grasses. Their primary function shall be to reliably protect against erosion. They shall be maintained as necessary to ensure the health and vigor of the primary species providing erosion protection. The species selected for each project shall be appropriate to the local climate, conditions, and surrounding or adjacent land uses. Preference should be given to the use of native species. Invasive or weed species shall not be acceptable. The species selected must be able to tolerate mowing to heights as low as 3 inches, as follows: at least once each year for inspection; and in anticipation of flood conditions and associated monitoring and flood-fighting activities.

b. If the local climate, hydraulic and hydrologic environment, soils, or other conditions will not support such grass species, then non-vegetative means of erosion control shall be employed, e.g. riprap, pavement, articulating concrete mats, or other engineered surface.

c. A maximum grass height is specified for embankment dams and their appurtenant structures (see Paragraph 3-4*c*, Vegetation-Free Zones).

4-9. Borrow Sites and Spoil Sites. Borrow sites and spoil sites shall be restored through proper regrading and revegetation.

CHAPTER 5
VEGETATION-RELATED MAINTENANCE AND REPAIR

5-1. Maintenance of Ground Cover. As ground cover in a flood damage reduction system, the primary purpose of grasses is the effective prevention of erosion; therefore, maintenance must assure a healthy, vigorous stand that is substantially free of weeds and bare spots. It will generally be necessary to periodically mow, graze, or burn grasses to permit proper inspection, manage pests, inhibit weed growth, or otherwise maintain the health and vigor of the plant stand. The appropriate time of year in which to conduct these maintenance activities will be a function of the species utilized as well as the motivating factor for the maintenance activity. For example, mowing to prohibit weed establishment may best be undertaken before the weed seeds become viable each year. The annual inspection may be scheduled to coincide with this period.

5-2. Operations and Maintenance Manual. For each project, it is important that the operations and maintenance manual include an annual maintenance program to control animal burrows and vegetative growth. It is also important that vegetation be managed in such a manner as to avoid the need for mechanized removal and associated embankment repair, and avoid any incidental growth and subsequent presence of endangered species that might prohibit access and activities necessary for operations or maintenance.

5-3. Removal of Non-Compliant Vegetation.

a. All vegetation not in compliance with this ETL shall be removed. A detailed removal plan shall be submitted to the local USACE District Levee Safety Officer for review and comment prior to removal of vegetation. The removal plan shall expand on the following basic requirements.

(1) By excavation, remove the trunk (or stem), stump, rootball and all roots greater than 1/2 inch in diameter – all such roots in, or within 15 feet of, the flood damage reduction structure shall be completely removed.

(2) Assure that the resulting void is free of organic debris.

(3) Fill and compact the void according to the original soil and compaction specifications: or, if no specifications exist, match adjacent soil and compaction.

b. Removal of non-compliant vegetation can create significant issues for the owner/operator, as maintenance may require environmental permits. The local sponsor must coordinate with the Corps and other appropriate agencies and obtain all the required environmental permits (including Corps of Engineers 404 permits) before conducting work within the levees. Mechanized land clearing below the plane of the "Ordinary High Water Mark" (defined at 33 CFR Part 328.3(e); in this document, see Figure 23 in Chapter 6 and the glossary in Chapter 7) will normally require Clean Water Act permits before work can commence. In regions with endangered or threatened species, and/or their critical habitat, vegetation removal of any kind may require clearance through the U.S. Fish and Wildlife Service or the National Marine Fisheries Service under the Endangered Species Act.

5-4. Repair of Animal Burrows. For proper procedures for the repair of animal burrows, refer to the latest edition of FEMA publication 473, *Technical Manual for Dam Owners, Impacts of Animals on Earthen Dams*.

CHAPTER 6
ILLUSTRATIONS

6-1. General.

a. The figures presented here are cross-sections and are organized as follows. Figure 1 illustrates the minimum vegetation-free zone required for a basic levee section and serves as an introductory example for use in Figure 2. Figure 2 illustrates the proper application of the vegetation-free zone with regard to various vegetation types and stages of development. Figures 3 through 23 provide additional examples, illustrating the minimum vegetation-free zone required for each of various flood damage reduction system configurations. Root-free zones are indicated in Figures 13, 14, 15, 17, and 19. Vegetation-free zone requirements for embankment dams and their appurtenant structures are illustrated in Figures 20 and 21 and are presented in greater detail in Paragraph 3-4. Figure 22 illustrates the vegetation-management zone. Figure 23 illustrates a levee section with the ordinary high water mark above the riverside toe.

b. For clarity, Figures 1 through 23 are not drawn to scale; however, Figures 24 and 25 are drawn to scale, using trees in the medium to large size range. The purpose of these two proportionally correct figures is to clearly illustrate realistic spatial relationships between trees (and their root systems) and levees.

c. Note that the minimum vegetation-free zone is not influenced by the type of erosion protection used, so figures are not specific in that regard, e.g., riprap is not shown.

GLOSSARY

Critical Structure
A critical structure is any component of a flood damage reduction system that contributes to system reliability.

Flood Damage Reduction (FDR) System
A flood damage reduction system is made up of one or more flood damage reduction segments that collectively provide flood damage reduction to a defined area. Failure of one segment within a system constitutes failure of the entire system. Failure of one system does not affect another system.

Forb
A forb is an herbaceous (non-woody) annual, biennial, or perennial plant, other than grass, sedges, and rushes (e.g. alfalfa, clover, vetch).

Herbivory
Herbivory is the consumption of vegetation by animals.

Ordinary High Water Mark (OHWM)
The Regulatory definition of the OHWM is provided at 33 CFR Part 328.3(e) and states: "The term **'ordinary high water mark'** means that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas." The OHWM determines the lateral extent of the jurisdiction of the Corps within Waters of the United States (see Figure 23).

Overbuild
Beyond the normal engineered cross-section of a levee, dam or appurtenant soil structure, overbuild is additional soil mass, fulfilling flood-damage-reduction design criteria and therefore subject to vegetation-free and root-free requirements.

Variance
A variance is a Corps-approved exemption from compliance with specific standards.

DRAFT

1. Overview

This purpose of this report is to present the results of a hydraulic impacts analysis that was performed for the West Sacramento Levee Improvement Project (WSLIP). The following WSLIP components, which potentially affect riverine water surface elevations, were included in this impact analysis:

- Raise West Sacramento levees to 1-in-200 year water surface elevations plus three feet for freeboard
- In-channel erosion protection design elements[1]

In addition to the project design elements, the water surface profiles developed for this analysis (without project and with project conditions) are based on the following criteria:

- Levees overtop without failing,
- Urban levees have minimum crown elevation of 1-in-200 year water surface plus three feet of freeboard,
- Folsom Joint Federal Project (JFP) in place
- The following components of the Three Rivers Levee Improvement Project are in place:
    - RD 784 Bear River levee setback,
    - RD 784 Western Pacific Interceptor Canal levee raise,
    - RD 784 Feather River levee setback
- Levee District 1 Feather River (west) levee setback is in place
- The Natomas Levee Improvement Project (NLIP) is in place
- Sacramento River Flood Control Project (SRFCP) levees with deficient design freeboard were raised to eliminate the deficiency.

DRAFT

Figure 1 shows the West Sacramento study area used in this analysis.

[1] Erosion protection design elements considered identified in the March 25, 2009 HDR Administrative Draft Report entitled "Alternatives Analysis: West Sacramento Area Flood Control Agency Levee Improvement Program". A similar configuration of erosion protection (rip rap armoring) in this reach was previously shown (June 27, 2005 MBK report for the Sacramento River Corridor Floodway Planning Forum entitled “Hydraulic Impact Analysis of Cumulative Development in Sacramento River Corridor Floodway”) to have no measurable impact on surrounding water surface elevations, so this WSLIP project element was not explicitly analyzed for this report.

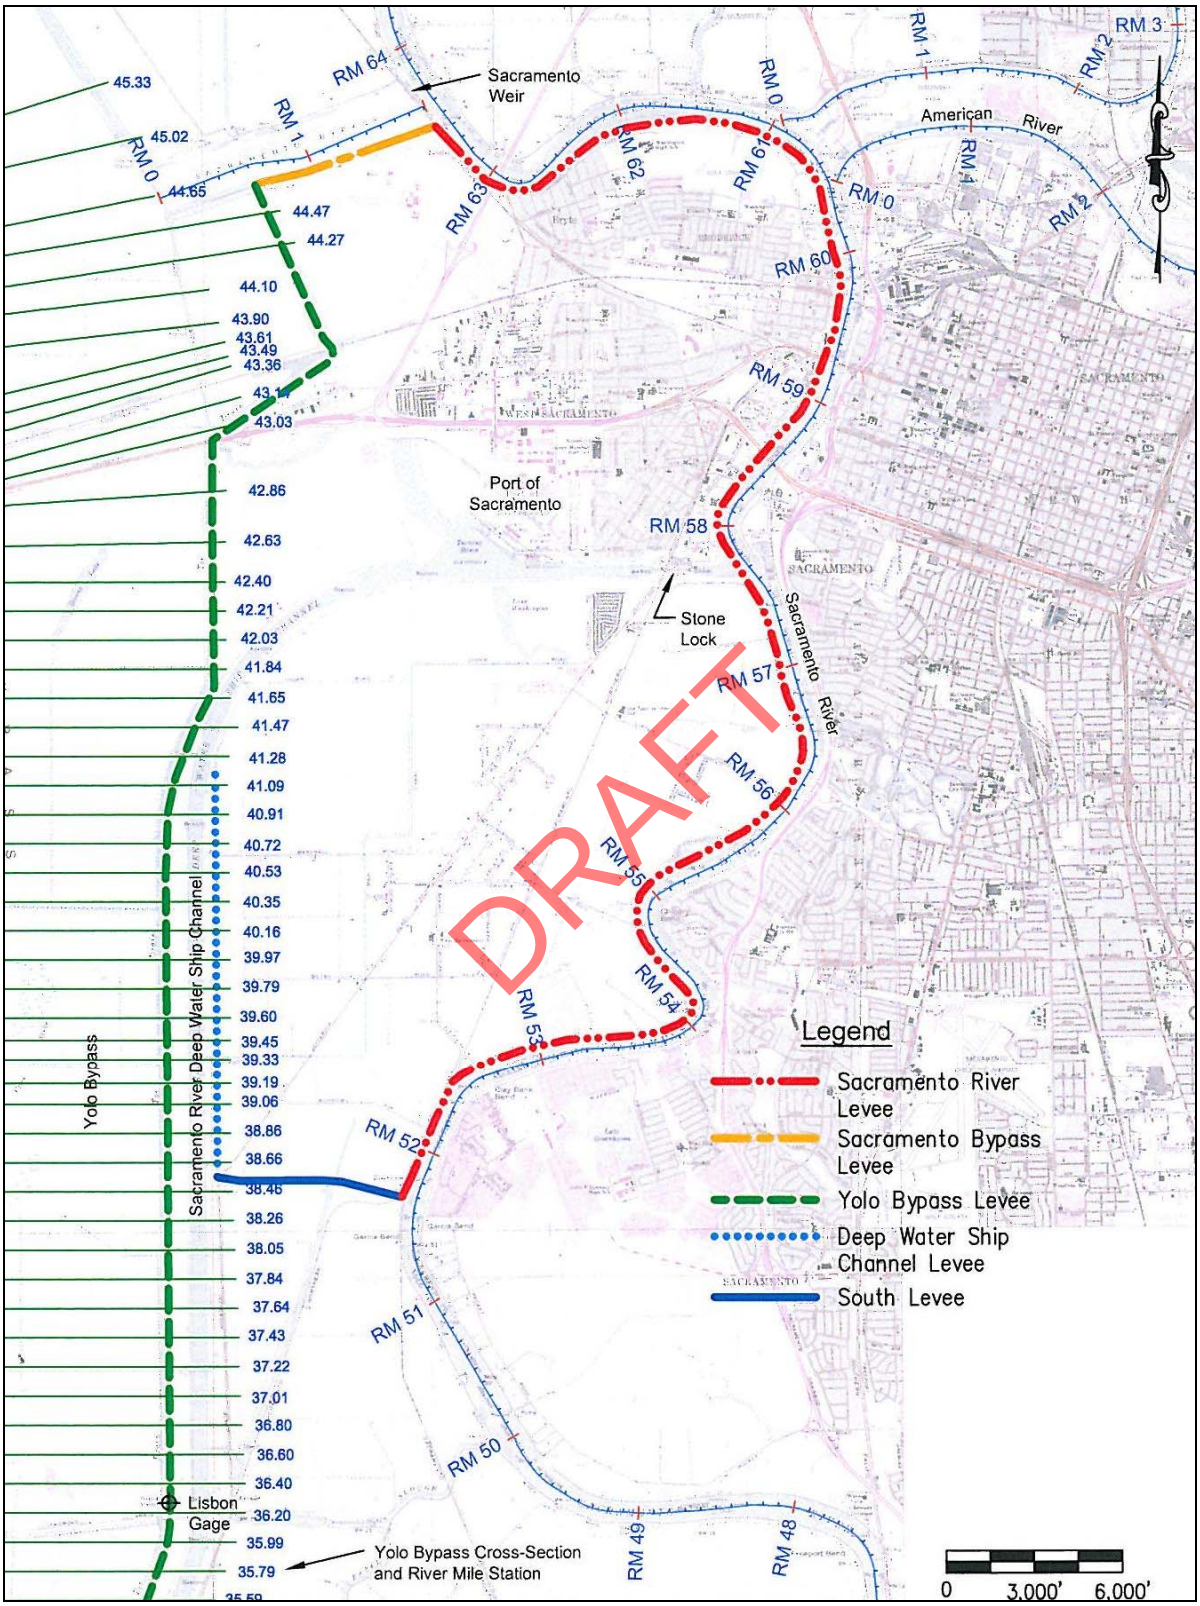

Figure 1. West Sacramento Study Area

2. Sacramento River Flood Control Project System Background

The perimeter levee system around West Sacramento is part of a larger integrated system of levees, dams, and bypass channels comprising the Sacramento River Flood Control Project (SRFCP; Figure 2). This system encompasses five historic flood basins in the Sacramento Valley (Colusa, Sutter, Feather, Yolo, and American Flood Basins) and the sub-basins contained therein. Planning, design, and construction of the SRFCP has been ongoing since the early 1900s under the leadership of the USACE and the State of California (State), with local levee and reclamation districts playing the principal role in operating and maintaining the system.

The SRFCP levees were set close to the river channel in order to improve navigation by having the rivers scour hydraulic mining sediments. The design of the system assumed no levee failures, but included five engineered diversions and one natural overflow diversion. The natural diversion is to Butte Basin, which is upstream from the SRFCP levees. This diversion did not include flowage easements because the Butte Basin is a historic flood basin. The five engineered diversions include two additional diversions to Butte Basin (Moulton and Colusa Weirs), one diversion to the Sutter Bypass (Tisdale Weir), and two diversions to the Yolo Bypass (Fremont and Sacramento Weirs). All of the engineered diversions included the acquisition of property rights to support the diversions. The deliberate planning, construction, and maintenance of the diversions ensured that they would function during flood conditions and serve as reliable features of the flood project.

DRAFT

Initially, the river channel and bypass levees in each segment of the system were constructed based on a standard geometry. The levees were designed with a predetermined freeboard allowance tied to specified flows and associated water surface elevations, generally matched to observed conditions during the 1907 and 1909 floods. Over time, the standard levee section was increased because of numerous levee failures. The minimum standard levee changed from a levee with a top width of 10 feet to one with a top width of 20 feet. In addition, the design flows were modified substantially on the Feather and American Rivers. This was the result of floods that occurred after 1909, which demonstrated these rivers could produce substantially greater flows than occurred during the 1907 and 1909 floods. Because numerous levee failures occurred along the Feather River levees between 1920 and 1934, these levees were set back and enlarged to accommodate greater flows. These changes were summarized in memorandums issued by the USACE which define the minimum freeboard requirements for each segment of the SRFCP, collectively referred to as the "USACE 1957 Profile." Over the years, the system capacity of the SRFCP was also greatly expanded by the construction of five major multiple-purpose reservoirs (Shasta, Black Butte, Oroville, New Bullards Bar, and Folsom Reservoirs), containing 2.7 million acre-feet of flood control storage space.

The record floods of 1986 and 1997 triggered additional system modifications. Although these floods were significantly larger than the 1907 and 1909 floods, the availability of reservoir storage largely prevented flows in the system from exceeding the design of the SRFCP. Nevertheless, numerous project levees experienced unexpectedly severe stress and some failed. This experience caused the USACE, the State, and their local partners to perform a series of geotechnical evaluations on the SRFCP levees and to adopt new, more rigorous levee design standards, including updated standards for seepage through and under project levees. To meet

these standards, USACE, the State, and local flood control agencies have made substantial investments in addressing identified deficiencies in levees throughout the SRFCP and in improving the level of flood protection provided by the levees, particularly in urban areas. Federal, State and local support for these levee improvements has been secured under several federally authorized projects, including the Sacramento Urban Levee Reconstruction Project, the American River Watershed Investigation, the West Sacramento Levee Improvement Project, the Sutter Basin Project and the Yuba River Basin Project. In the aftermath of the flooding of New Orleans, these authorized projects are being expanded to support an even broader scope of urban levee improvement activity.

The evolution of these urban levee improvements is occurring within a SRFCP management framework that has historically allowed necessary adaptations to the system without undermining its basic operational principles. These principles may be summarized as follows. First, the SRFCP is not intended to provide a uniform level of flood protection (statistical probability of flooding) to the various sub-basins within the protected area. Rather, each sub-basin is protected by levees that are required to at least meet the SRFCP minimum geometrical standards, including freeboard reflecting the water surface profile prescribed for that segment of the system. Second, each sub-basin's flood protection is dependent on the fitness of its own levees and not on the condition (or failure) of any other sub-basin's levees. Accordingly, each sub-basin has the right to keep its levees in the fittest possible condition to ensure that these levees will perform as reliably as possible in a flood. This right ensures the orderly operation and maintenance of the system since even the most modest levee work has the potential to trigger a "transfer of risk" from one sub-basin to another, at least in theory; and there are no data or modeling tools available to quantify such transfers of risk, assess their significance, or determine how they might be mitigated. Third, for this reason, the administration of the SRFCP has historically relied on "change in design water surface elevation" as the guideline for evaluating the effects of any proposed levee work.

DRAFT

The strictest scrutiny is given to levee work involving physical changes in the geometry of the river channel since these changes have the most potential to alter water surface elevations prescribed by the SRFCP design water surface profiles (SRFCP 1957 profiles). This work includes placement of fill or construction of structures in the floodway, construction of new levees, relocation of existing levees, excavation within the floodway, construction of large berms for protecting riverbanks, raising an existing levee (waterside raise), construction of a new bypass, and planting of vegetation within the floodway. Landside levee work of the type proposed as part of the NLIP, such as placing a cutoff wall in a levee, adding a seepage berm to a levee, placing a field of seepage relief wells along a levee, raising a levee (landside raise), widening a levee (increased top width), and relocating a seepage ditch, is also strictly scrutinized; but is not likely to cause impacts.

The standard procedure for this evaluation is to use hydrologic and hydraulic computer modeling tools such as, HEC-1, HEC-2, UNET, HEC-RAS, RMA2, FESWMS, etc. The analysis consists of calibrating the hydraulic model to historic flood events using high-water marks and stream gage data. The calibration activity is normally conducted on a system-wide basis instead of a site-specific basis. However, data available for computer model calibration can be sparse or nonexistent. In addition, assumptions must be made regarding reservoir operations. Because all

of the reservoirs that contribute to the operation of the SRFCP (Shasta, Black Butte, Oroville, New Bullards Bar and Folsom) are governed by water control manuals issued by USACE, current reservoir operations are assumed to continue except where it is reasonably foreseeable that the current operation would change. Examples of such changes are at the Folsom Dam and Reservoir: where Congress has directed USACE to formalize the variable space storage operation that has been in effect by agreement between SAFCA and the U.S. Bureau of Reclamation since 1995; and where water control structures are being modified as part of the Folsom Dam Joint Federal Project.

DRAFT

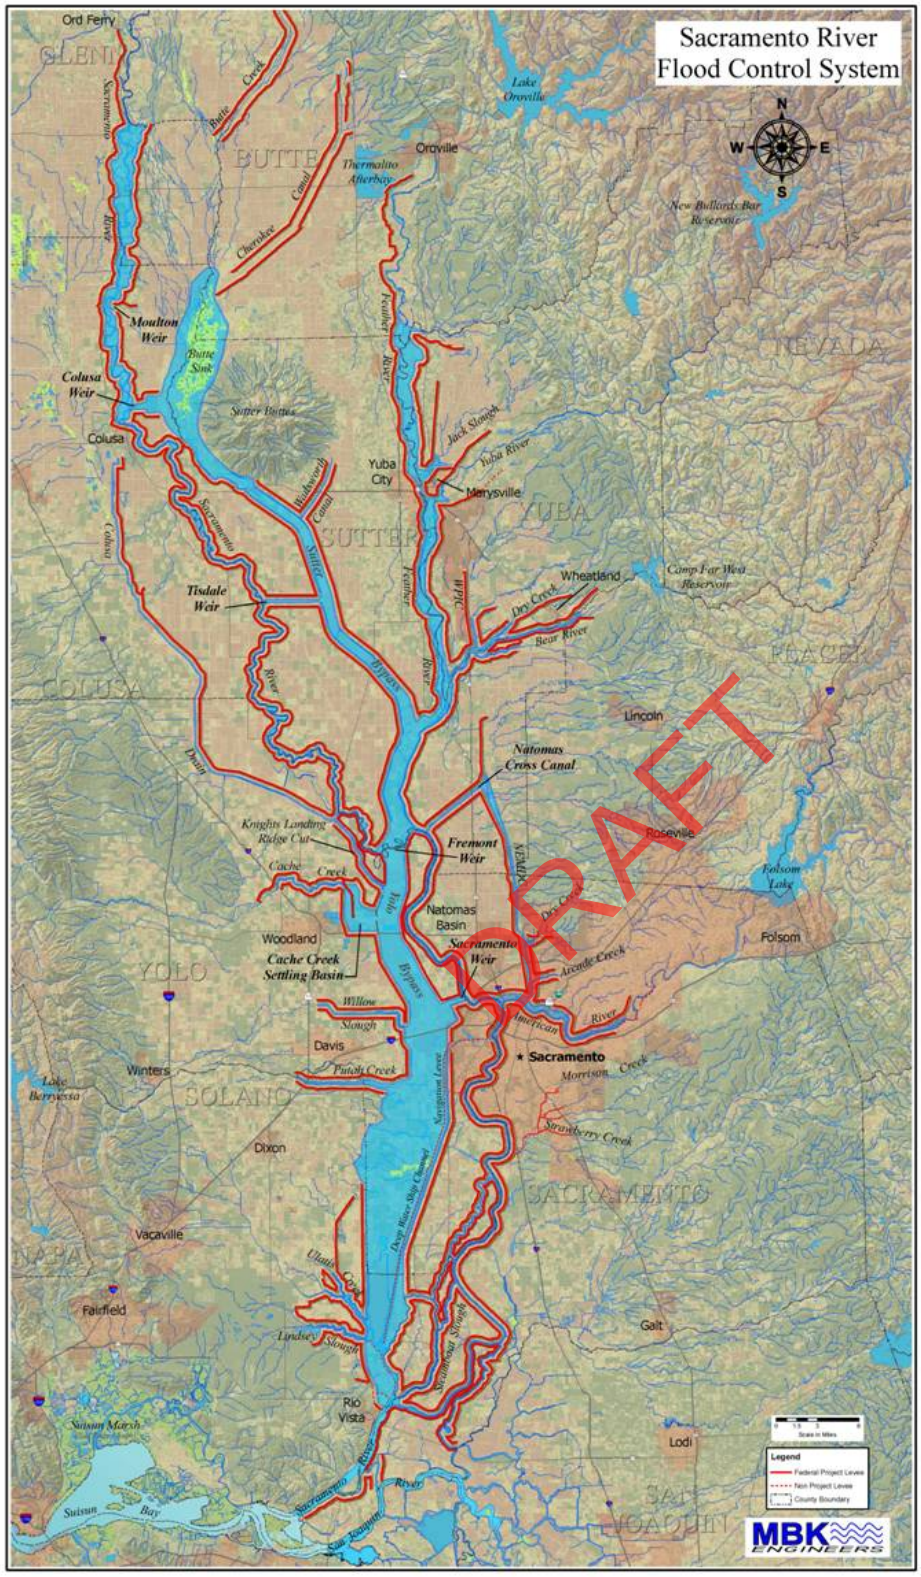

Figure 2. Sacramento River Flood Control System Map

3. Modeling Analysis

3.1 Approach

Table 1 defines the conditions analyzed and the various modeling assumptions that went with those conditions. As this table shows, an "Existing", "Without Project", and a "With Project" condition were analyzed.

Table 1. Definition of Model Assumptions for Various Conditions

Condition	Top of Levee Assumption	Levee Failure Assumption	Reservoir Ops Assumption	Additional
Existing	Existing top of levee grade April 2008	No Levee Failure	Existing reservoirs and current (2008) operation criteria	
Without Project	Same as Existing with the following changes. Federally authorized improvements to Folsom Dam are implemented and urban area levees outside the West Sac Basin are assumed to have levees at 1-in-200 year water surface + three feet of freeboard. WSLIP levees same as Existing Condition.	No Levee Failure	Same as Existing except Folsom Dam will be operated in accordance with the Joint Federal Project currently under construction	
With Project	Same as Without Project except WSLIP levees raised to design level (1-in-200 year water surface + three feet of freeboard)	No Levee Failure	Same as Without Project	In-channel erosion protection

DRAFT

3.2 Hydraulic Model

As part of the Sacramento and San Joaquin River Basins Comprehensive Study (Comp Study), the U.S. Army Corps of Engineers (USACE) developed a UNET model of the Sacramento River basin, the extent of which is shown in Figure 3 and listed in Table 2. UNET is a one-dimensional unsteady open-channel flow model with the ability to simulate exchange of flow between river channels and floodplains, which was originally developed for the USACE Hydrologic Engineering Center (HEC). UNET is the predecessor of the unsteady flow routine in the current

HEC-RAS program. UNET was used for this model because at the time of the model development the unsteady flow routine had not yet been incorporated into the HEC-RAS program. Converting the Sacramento River UNET model to HEC-RAS is a significant task and is currently being undertaken by the USACE. In the meantime the UNET model is being used for hydraulic analyses in the Sacramento River basin.

MBK Engineers has made significant modifications and refinements to the Sacramento River UNET model, initial documentation of which is provided in Appendix A. The calibration simulation has been updated with the June 2008 version of the model, but the June 2003 report provided in Appendix A has not yet been updated. Maximum water surface profiles for the reaches surrounding West Sacramento showing the results of the June 2008 model calibration simulation are provided in Appendix B. The USACE performed a review of the MBK version of the Sacramento River UNET model in late 2005 and early 2006, culminating in an email from John Carroll, then Chief of the USACE Sacramento District Hydraulic Design Branch, on 6/13/06 which stated the following:

"Based on our review of the MBK model, it is acceptable to use this tool for your ongoing design purposes for remediation work on the Natomas Area Levee Project. The SAFCA Natomas Area Levee Project report indicates a design levee profile based on this model's 200-year water surface profile plus 3 feet. We concur in the application and recommend addition of this freeboard value to the 200-year water surface profile to determine the minimum design top of levee profile."

DRAFT

Table 2. Sacramento River UNET Model Boundaries

Boundary Type	River	Location	River Mile	
			USGS	Comp Study
Upstream	Sacramento River	Hamilton City	219.1	215.5
	Feather River	Thermalito Afterbay Outlet	59.0	58.6
	Yuba River	Below Englebright Dam	---	22.0

	American River	Fair Oaks gage	---	22.0
Downstream	Sacramento River	At Three Mile Slough	9.4	9.5
	Georgiana Slough	At Mokelumne River	---	---

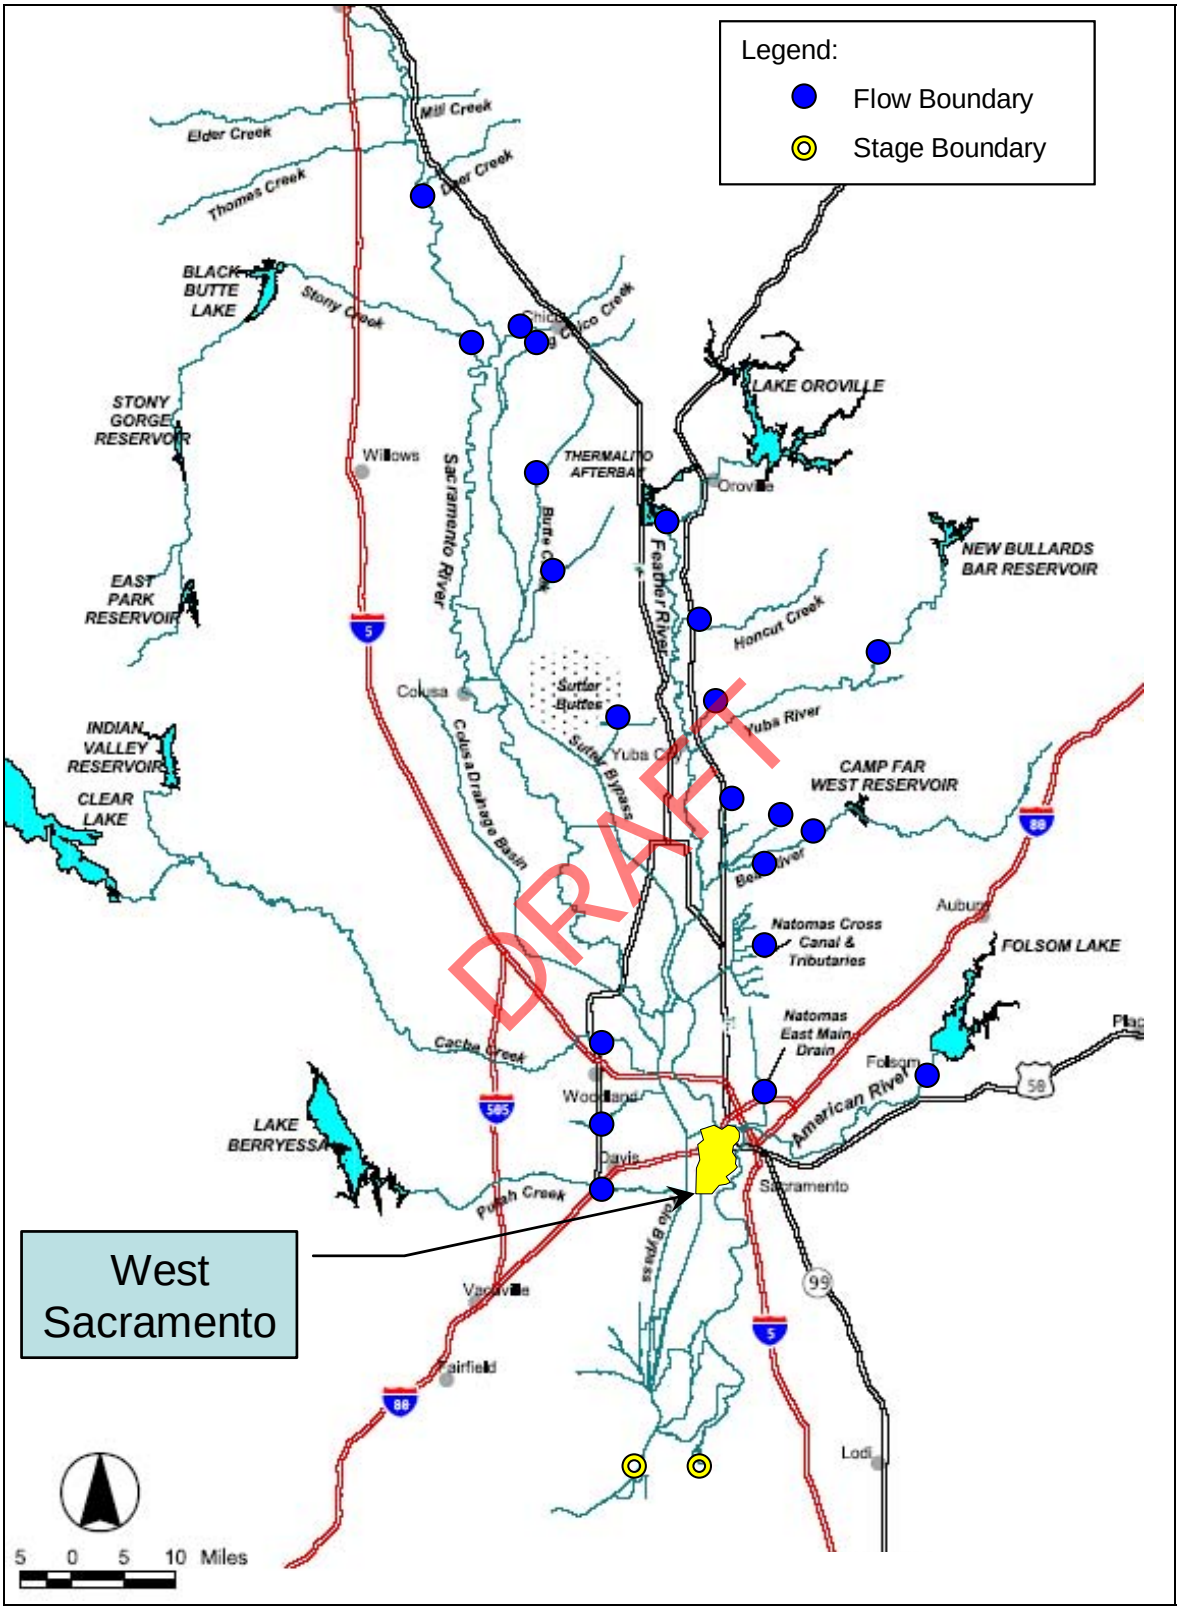

Figure 3. Sacramento River UNET Model Boundaries (Base Map by USACE)

3.2.1. Model Changes from December 2008 to Present

The December 4, 2008, report entitled "Supplemental Report for the City of West Sacramento Levee Alternatives Hydraulic Analysis" details the hydraulic model version used in that analysis. Since the development of that report, changes have been made to the hydraulic model which was used in this analysis. Those changes are:

- Revised/added potential overtop locations for American R, NEMDC, Feather R, Yolo Bypass, Sacramento Bypass, Sacramento River, and Sutter Bypass.
- Added bridge data for bridges crossing the upper & lower NEMDC and the PGCC.
- Revised weir C's: natural bank overflows=2.49, floodplain connections=2.59, adjacent stream connections=3.19; flood weirs=4.0.
- Renumbered NEMDC cross-section above RM2.2 to correspond to Comp Study river mile stationing (sections were from 1989 HEC2 file and stationing differed from Comp Study stationing by approximately -0.05 miles).

3.3 Hydrology

DRAFT

The USACE, as part of the Comp Study, developed input flows for the Comprehensive Study Sacramento River UNET hydraulic simulation model for the following hypothetical storm centerings (* indicates used in this analysis):

- Sacramento River Mainstem at Latitude of Ord Ferry
- Sacramento River Mainstem at Latitude of Sacramento*
- Stony Creek
- Shasta to Ord Ferry
- Butte Creek
- Feather River at Oroville
- Feather River at Shanghai Bend*
- Yuba River
- Bear River
- American River*
- Cache and Putah Creeks

The storm centerings relied on historical flood patterns in the upstream basin to define the shape and magnitude of the flow contributions from each of the basins, and were designed to stress specific locations in the river system. For example, the Sacramento River Mainstem at Latitude of Sacramento centering was designed to place the most stress on the system at the latitude of Sacramento.

A review of previous simulations made with the various storm centerings indicated that the Sacramento River Mainstem at Latitude of Sacramento, Feather River at Shanghai Bend, and American River storm centerings were capable of producing the highest water surface elevations in the project area. The water surface elevation was therefore determined by simulating all three of these centerings and using the highest values.

More detail on the hydrologic data used in this analysis, including additional description and flow hydrographs, can be found in the December 4, 2008, report entitled "Supplemental Report for the City of West Sacramento Levee Alternatives Hydraulic Analysis".

3.4 Levee Performance

As previously noted, the hydraulic impact analysis assumed that levees would overtop without failing. In other words, levees that overtopped were treated as weirs, allowing water to leave or return to the river channel. Available top of levee data was reviewed and weirs were included in the model at potential overtopping locations.

4. Modeling Analysis Results

DRAFT

Tables 3, 4 and 5 summarize the maximum water surface elevations at several locations in and around the project area for the Existing, Without Project, and With Project conditions for the 1-in-100 year, 1-in-200 year and 1-in-500 year flood events, respectively.

There are no calculated impacts of the WSLIP for the 1-in-100 year and 1-in-200 year flood events. For the 1-in-500 year flood, the maximum water surface elevation change on the Sacramento River between the Without Project and With Project conditions is 0.10 feet at River Mile 59.0 (0.09 is maximum difference for the selected locations in Table 5). However, even these relatively minor computed impacts are considered extremely implausible, given the significant portion of upstream and adjacent levees overtopped (see Table 6 for quantification of the levee overtopping from this analysis and Appendix A for analysis where upstream levees are allowed to fail) by this flood without any levee failures occurring.

Computed water surface elevation profiles for each of the key flow conditions in the project area are shown in Figures 4 through 15. (Figures 4 through 7 show the water surface elevation profiles of the 1-in-100 year flood; Figures 8 through 11 show the water surface elevation profiles of the 1-in-200 year flood; Figures 12 through 15 show the profiles for the 1-in-500 year flood.)

5. Support for Impact Analysis Methodology

5.1 California Legislature

Support for the hydraulic impact analysis for the WSLIP described herein has been given by the State Legislature to a similarly constructed hydraulic impact analysis developed for the Sacramento Area Flood Control Association (SAFCA) for a project consisting of levee strengthening and raising components similar to those in the WSLIP.

Consistent with its approval of a new more rigorous standard for urban flood protection, the State Legislature approved "the project features necessary to provide a 200-year level of flood protection along the American and Sacramento Rivers and within the Natomas Basin as described in the final engineer's report dated April 19, 2007, adopted by the SAFCA." (Statutes of 2007, Chapter 641 [amending Water Code Section 12670.14(b)]). Moreover, in connection with this approval, the legislature adopted the following findings and declarations (Statutes of 2007, Chapter 641, Section 1[k]):

> *As evidenced by the environmental impact reports certified in connection with these projects, including the hydrology and hydraulics impact analysis set forth in the environmental impact report prepared by the Sacramento Area Flood Control Agency with regard to local funding mechanisms for comprehensive flood control improvements for the Sacramento area dated February 2007, the increase in flood protection associated with improving the American and Sacramento River levees and modifying Folsom Dam will be accomplished without altering or otherwise impairing the design flows and water surface elevations prescribed as part of the Sacramento River Flood Control Project. Accordingly, these improvements will not result in significant adverse hydraulic impacts to the lands protected by the Sacramento River Flood Control Project. Thus, it is not necessary or appropriate to require these projects to include hydraulic mitigation.*
>
> *The projects authorized in Section 12670.14 of the Water Code will increase the ability of the existing flood control system in the lower Sacramento Valley to protect heavily urbanized areas within the City of Sacramento and the Counties of Sacramento and Sutter against very rare floods without altering the design flows and water surface elevations prescribed as part of the Sacramento River Flood Control Project or impairing the capacity of other segments of the Sacramento River Flood Control Project to contain these design flows and to maintain water surface elevations. Accordingly, the projects authorized in that section will not result in significant adverse hydraulic impacts to the lands protected by the Sacramento River Flood Control Project and neither the Reclamation Board nor any other state agency shall require the authorized projects to include hydraulic mitigation for these protected lands.*

DRAFT

Although these findings are not legally binding, they indicate the legislature's concurrence with SAFCA's approach to analyzing hydraulic impacts. Additionally, Congress authorized raising and strengthening a twelve-mile reach of the Sacramento River east levee in the 1996 Water

Resources Development Act ("WRDA"), and for raising and strengthening all five-plus miles of the NCC south levee in the 1999 WRDA without in either case requiring hydraulic mitigation, offers additional indirect legislative support for SAFCA's approach.

The approach used in this hydraulic impact analysis for the WSLIP is similarly constructed and reported to that utilized by SAFCA.

5.2 U.S. Army Corps Headquarters

USACE has been using a risk-based analysis for economic evaluation for some time and has been moving to a risk-based analysis for system performance, largely for certification of levees for FEMA. However, in his memo dated *August 2, 2007, Subject: Section 408 Approval of a Flood Control Project Alteration - Sacramento River Flood Control Project, Feather and Yuba Rivers, California,* Deputy Director of Civil Works Steven L. Stockton indicated that the discussion of flood protection in terms such as 100-year or 200-year level of protection is acceptable to comply with NEPA and other environmental statues. However, a risk-based analysis as required by ER 1105-2-100 and ER 1105-2-101 will be needed to determine the terms of any eventual Section 104 reimbursement.

DRAFT

6. Conclusion

Raising and strengthening portions the federal project levee system protecting West Sacramento and implementing in-channel erosion protection measures, as proposed by the City, would not result in any significant, adverse hydraulic impacts to other sub-basins protected as part of the SRFCP. Furthermore, these improvements would be consistent with the principles that have guided the management of the SRFCP over the past century and with the policies adopted by the State Legislature calling for an immediate and comprehensive effort to increase the level of flood protection provided to West Sacramento and the other urban areas within the SRFCP.

Appendix A

Sensitivity Analysis: Upstream Levees Fail When Overtopped

DRAFT

A-1. Approach

It is unknown how upstream levees will perform for flood events of large magnitude, such as those utilized for this report (1-in-100 year, 1-in-200 year, and 1-in-500 year). The analysis presented in this report utilized the assumption that upstream levees would not fail when overtopped. This is a conservative assumption in terms of producing downstream water surface elevations, since water is not allowed to levee the riverine system due to levee failures. This appendix presents the results of the WSLIP hydraulic impact analysis with the upstream levee performance assumption that levees fail when overtopped.

Table A-1 defines the conditions analyzed and the various modeling assumptions that went with those conditions. As this table shows, an "Existing", "Without Project", and a "With Project" condition were analyzed.

Table A-1. Definition of Model Assumptions for Various Conditions

Condition	Top of Levee Assumption	Levee Failure Assumption	Reservoir Ops Assumption	Additional
Existing	Existing top of levee grade April 2008	No Levee Failure	Existing reservoirs and current (2008) operation criteria	
Without Project	Same as Existing with the following changes. Federally authorized improvements to Folsom Dam are implemented and urban area levees outside the West Sac Basin are assumed to have levees at 1-in-200 year water surface + three feet of freeboard. WSLIP levees same as Existing Condition.	Levees Fail When Overtopped	Same as Existing except Folsom Dam will be operated in accordance with the Joint Federal Project currently under construction	
With Project	Same as Without Project except WSLIP levees raised to design level (1-in-200 year water surface + three feet)	Levees Fail When Overtopped	Same as Without Project	In-channel erosion protection

DRAFT

A-2. Results

Tables A-2, A-3 and A-4 summarize the maximum water surface elevations at several locations in and around the project area for the Existing, Without Project, and With Project conditions for the 1-in-100 year, 1-in-200 year and 1-in-500 year flood events, respectively. As these tabular results indicate, when upstream levees are allowed to fail, there are no impacts of the proposed WSLIP project calculated for events up to and including the 1-in-500 year flood.

Table A-5 summarizes the magnitude of levee failures for the 1-in-100 year, 1-in-200 year, and 1-in-500 year flood events.

UTILITY ASSESSMENT FOR BASIN-WIDE PROBLEM IDENTIFICATION REPORT

West Sacramento Levee Evaluation Project ***October 29, 2007***

Reviewed by: Eric Nagy, PE; Michael Vecchio MV 10/25/07

Prepared by: Brett Bourgeois, EIT

1. Introduction

The City of West Sacramento goal is to provide the community with the maximum feasible level of flood protection that can be justified within State and Federal standards. The minimum acceptable level of protection being sought by the City is for protection from a 200-year flood event. This is a flood that has a 1 in 200 or 0.5% chance of occurring in any given year.

HDR Engineering, Inc. (HDR) is leading a team of consultants in evaluating the levee system that provides flood protection to the City of West Sacramento. The study area associated with this evaluation is shown on Figure 1. Evaluation components include the following:

- Problem identification for the existing levees
- Alternatives analysis of various potential levee improvement methods
- Preliminary cost estimates associated with those improvements

The problem identification phase includes an assessment of the following:

- Geotechnical conditions
- Levee freeboard and geometry
- Existing utility crossings
- Erosion

Supplementary studies in potential environmental and cultural resources impacts and risk analysis have also been initiated.

2. Objective

The objective of this technical memorandum is to identify the existing underground and aboveground utility crossings as described in encroachment permits obtained from the State of California Reclamation Board.

3. Background

The City of West Sacramento has embarked upon a comprehensive evaluation of the flood protection infrastructure that surrounds the City. The City is bound on all four sides by a levee system that protects the region from flooding. The pursuit of a comprehensive evaluation of these levees is a necessary step toward determining the level of flood protection currently afforded by the existing flood protection infrastructure.

The initial step in conducting a comprehensive evaluation of the West Sacramento levee system is to identify the magnitude and severity of deficiencies in the current system. The collection and analysis of the engineering data necessary to identify and characterize these deficiencies within the West Sacramento levee system is currently underway. The findings of this initial phase will be captured in a Problem Identification Report.

Levee deficiencies identified during the problem identification phase will be studied further in the alternatives analysis phase. During this step, potential levee improvement alternatives for each identified deficiency will be formulated and compared against selection criteria for the recommendation of a preferred levee improvement alternative. This step includes preliminary technical evaluation, preliminary environmental assessment and the development of cost estimates for each alternative to ensure that the investment of public funds in any levee improvement project is efficient and effective. The findings of this phase will be captured in an Alternatives Analysis Report.

Both the problem identification phase and the alternatives analysis phase will serve as the basis for further technical evaluations to determine the economic impacts and environmental consequences of the various levee improvement alternatives versus their associated costs.

4. Study Area

The current comprehensive levee evaluation extends over the entire West Sacramento basin. This basin encompasses portions of the Sacramento River, the Yolo Bypass, the Sacramento Bypass, and the Sacramento Deep Water Ship Channel (DWSC). The levee system associated with these waterways includes over 50 miles of levees in Reclamation District (RD) 900, RD 537, Maintenance Area 4, and the Deep Water Ship Channel.

4.1. Study Reach Descriptions

For the purposes of this project, the West Sacramento basin levees have been split into nine reaches. Each reach described in this section is shown on Figure 1. A physical description of each reach follows:

4.1.1. Sacramento River West North Levee

This reach extends along the right bank of the Sacramento River from its confluence with the Sacramento Bypass downstream approximately 6.0 miles to the entrance to the barge canal.

4.1.2. Sacramento River West South Levee

This reach extends along the right bank of the Sacramento River from the entrance of the barge canal downstream approximately 6.4 miles to the South Cross Levee.

4.1.3. Port North Levee

This reach includes the combination of levees, structures, and high ground that exist along the northern bank of the barge canal and deep water ship channel from the Sacramento River west to the levee along the left bank of the Yolo Bypass. This area includes the ground surrounding the Port of Sacramento's turning basin.

4.1.4. Port South Levee

This reach includes the combination of levees and high ground that exist along the southern bank of the barge canal and deep water ship channel from the Sacramento River west to the levee on the east bank of the deep water ship channel.

4.1.5. South Cross Levee

This reach extends along the South Cross levee for approximately 1.2 miles from the intersection of Jefferson Boulevard and the levee along the east bank of the deep water ship channel to the Sacramento River where it intersects the southern limit of Sacramento River South Levee reach.

4.1.6. DWSC East Levee

This reach extends along the east bank of the deep water ship channel for approximately 2.8 miles from the high ground comprising the western limit of the Port South Levee reach in a southerly direction to the intersection of Jefferson Boulevard with the South Cross Levee.

4.1.7. DWSC West Levee

This reach extends along the left bank of the Yolo Bypass approximately 22 miles from its intersection with the western limit of the Port North Levee in a southerly direction toward Miners Slough.

4.1.8. Yolo Bypass Levee

This reach extends along the left bank of the Yolo Bypass approximately 3.8 miles from its intersection with the left bank levee of the Sacramento Bypass in a southerly direction to its intersection with the DWSC West Levee.

4.1.9. Sacramento Bypass Levee

This reach extends along the left bank of the Sacramento Bypass approximately 1.2 miles from the Sacramento Weir in a westerly direction (downstream) to its confluence with the left bank levee of the Yolo Bypass. This reach does not include the training levee that extends in a westerly direction approximately 0.4 miles into the Yolo Bypass.

5. Utility Inventory and Assessment

5.1. Utility Inventory

As part of the problem identification phase for the City of West Sacramento levee system, an initial review and assessment of the known levee utility crossings has been completed. The purpose of the utility assessment is two-fold: 1) to locate the known utilities and to identify potential conflicts with levee improvements alternatives and 2) to verify that the existing utility crossings meet with the requirements of the Federal Emergency Management Agency (FEMA) and the Reclamation Board.

A general assessment of the utilities within the basin has been completed by obtaining encroachment permits that contain underground and aboveground utilities which are contained in, on, or above the current levee footprint from the Reclamation Board. It should be noted that construction has been completed and utilities have been installed without proper permitting through the Reclamation Board; therefore only a general assessment has been performed. A detailed assessment will be completed during the project design phase. Encroachment permits that have been obtained from the Reclamation Board which contain underground utilities are summarized in Table 1. Encroachment permits that have been obtained from the Reclamation Board which contain aboveground utilities are summarized in Table 2. Figure 2 shows the levee reaches and the stationing convention for each levee reach.

5.2. Utility Assessment

A complete listing of all permitted utilities can be found in Tables 1 and 2. Permits are not required for utilities installed in the South Cross Levee because it is not a Federally-authorized levee. The tables also show the elevations of the underground utilities, and whether they are above or below the 100-year flood level. According to the requirements of the Reclamation Board (California Code of Regulations, Title 23, Article 8, Section 123), pipes that cross the levees shall have invert elevations above the 100-year water surface (i.e., the pipe should cross within the levee freeboard area) unless otherwise noted, and pipes open to the waterway should have a means of positive shut off.

For the underground utilities shown below the 100-year flood elevation, additional design may be required to make them comply with Reclamation Board requirements. For reaches where a cutoff wall is the preferred alternative, pipes crossing the levee will either have to be protected in place, or will have to be plugged while construction occurs and then reassembled after the cutoff wall construction. Temporary pipes may also be required during construction.

Temporary removal of overhead lines crossing the levee may be required for the cutoff wall option to provide adequate clearance for construction machinery. For the seepage berm option, poles within the working area may have to be relocated off the berm per United States Army Corps of Engineers requirements, or may have to be modified when relocations is not an option.

6. Summary

A general utility inventory and assessment was preformed by obtaining permits that contain underground and overhead utilities which are contained in, on, or over the current levee footprint from the Reclamation Board. The findings of those permits are presented in the attached Tables. It is important to note that there possibly exist utilities that are not identified in the permits from the Reclamation Board, in addition to the possibility that utilities are inaccurately located due to poor copies of permits. A detailed inventory of utilities, including obtaining and reviewing available as-built drawings, will be completed as part of the design phase of the project.

Appendix E

Air Quality Information

Appendix E
Air Quality Information

Introduction

This appendix includes the modeling results for the air quality emissions for the CHP Academy EIP alternatives and The Rivers EIP alternatives.

To assist in the determination of effects, various quantitative models are available to predict emissions and particulate matter generation. Two such models are URBEMIS and SacRCEM. While SacRCEM has typically been used for other recent levee improvement projects in the Sacramento Valley, both models have been applied to simulate the project-level air quality effects of the WSLIP. Given the similarity in the architecture of the two models, for ROG, NO_X, and CO_2, the outputs from the two models are very similar and any variance is considered not statistically significant. WSAFCA has selected to use the results of URBEMIS for quantitative determination of effects, effect findings, and mitigation efficacy.

This appendix includes the construction assumption and results tables of both the models for the WSLIP EIPs:

- **Mitigated construction emissions.** Construction emissions results tables for CHP Academy EIP Applicant Preferred Alternative (referred to as Alt 1 for modeling purposes), and Alternative B (referred to as Alt 2 for modeling purposes) and The Rivers EIP APA and Alternative B.
- **Unmitigated construction emissions.** Unmitigated construction emissions for both alternatives for CHP Academy and The Rivers, respectively.
- **Flood improvement data assumptions.** Construction data assumption tables for both alternatives for CHP Academy and The Rivers, respectively.
- **Recreation improvement data assumptions.** Construction data assumption tables for the recreational elements at the CHP Academy and The Rivers.
- **URBEMIS and SacRCEM results.** Four tables presenting side by side results of the URBEMIS and SacRCEM models for the APA and Alternative B for both CHP Academy EIP and The Rivers EIP, respectively.

WSLIP Construction Emissions Results URBEMIS and Sacramento RCEM

Tables E-1 through E-4, below, show the construction emissions results from the URBEMIS and Sacramento RCEM models for the CHP Academy EIP alternatives and The Rivers EIP alternatives.

Table E-1. Estimated Construction Emissions: CHP Academy APA, URBEMIS (U) and SacRCEM (S)

Plant Species Observed During Reconnaissance-Level Field Visits to Program Area

Scientific Name	Common Name	CDFA Rating	Cal-IPC Rating
Acer negundo var. *californicum*	box elder		
Ailanthus altissima	tree-of-heaven	C	Moderate
Aira caryophyllea	silver hairgrass		
Alnus rhombifolia	white alder		
Anagallis arvensis	scarlet pimpernel		
Anthemis cotula	mayweed		
Artemisia douglasiana	mugwort		
Arundo donax	giant reed	B	High
Avena barbata	slender wild oat		Moderate
Avena fatua	wild oat		Moderate
Baccharis pilularis	coyote brush		
Brassica nigra	black mustard		Moderate
Bromus carinatus	California brome		
Bromus diandrus	ripgut brome		Moderate
Bromus hordeaceus	soft chess		Limited
Bromus madritensis ssp. *rubens*	red brome		High
Camissonia sp.	suncups		
Capsella bursa-pastoris	shepherd's purse		
Carduus pycnocephalus	Italian thistle	C	Moderate
Carex barbarae.	valley sedge		
Carex sp.	sedge		
Catalpa sp.	catalpa		
Centaurea solstitialis	yellow star-thistle	C	High
Centromadia pungens	common tarweed		
Chamomilla suaveolens	pineapple weed		
Cichorium intybus	chicory		
Cirsium vulgare	bull thistle	C	Moderate
Conium maculatum	poison hemlock		Moderate
Convolvulus arvensis	bindweed	C	
Conyza canadensis	horseweed		
Croton setigerus	turkey mullein		
Cynodon dactylon	Bermuda grass	C	Moderate
Cyperus eragrostis	tall flatsedge		
Echinochloa crus-galli	barnyard grass		
Epilobium brachycarpum	panicled willow-herb		
Equisetum sp.	horsetail		
Erodium botrys	big heronbill		
Erodium cicutarium	redstem filaree		Limited
Erodium moschatum	whitestem filaree		
Eucalyptus sp.	eucalyptus		

Scientific Name	Common Name	CDFA Rating	Cal-IPC Rating
Ficus carica	edible fig		Moderate
Filago gallica	filago		
Foeniculum vulgare	sweet fennel		High
Fraxinus latifolia	Oregon ash		
Galium aparine	bedstraw		
Gastridium nitidum	nitgrass		
Geranium dissectum	cutleaf geranium		Limited
Geranium molle	dovefoot geranium		
Gnaphalium luteo-album	cudweed		
Hedera helix	English ivy		High
Helianthus annuus	sunflower		
Hirschfeldia incana	Mediterranean mustard		Moderate
Hordeum marinum ssp. *gussoneanum*	Mediterranean barley		Moderate
Hordeum murinum ssp. *leporinum*	foxtail barley		Moderate
Juglans sp.	black walnut		
Juglans regia	English walnut		
Juncus sp.	rush		
Lactuca serriola	prickly lettuce		
Lagerstroemia indica	crapemyrtle		
Lathyrus tangitanus	Tangier pea		
Lepidium latifolium	perennial pepperweed	B	High
Leymus triticoides	valley wild rye		
Ligustrum sp.	privet		
Liquidamber styraciflua	liquid amber		
Lolium multiflorum	Italian ryegrass		Moderate
Lotus corniculatus	birdfoot trefoil		
Ludwigia sp.	water primrose		High
Lupinus bicolor	miniature lupine		
Lythrum hyssopifolium	hyssop loosestrife		Limited
Malva neglecta	common cheeseweed		
Malva parviflora	cheeseweed		
Medicago polymorpha	bur clover		Limited
Melilotus sp.	sweetclover		
Morus alba	mulberry		
Nerium oleander	oleander		
Nicotiana glauca	tree-tobacco		Moderate
Paspalum dilatatum	dallisgrass		
Paspalum distichum	knot grass		
Phalaris sp.	canary grass		
Phoenix canariensis	Canary Island date palm		
Phoradendron macrophyllum	big-leaf mistletoe		
Phyla nodiflora	lippia		
Picris echioides	bristly ox-tongue		Limited
Plantago major	common plantain		
Platanus racemosa	western sycamore		

Scientific Name	Common Name	CDFA Rating	Cal-IPC Rating
Platanus sp.	plane tree		
Poa annua	annual bluegrass		
Polygonum arenastrum	common knotweed		
Polygonum sp.	knotweed		
Populus fremontii ssp. *fremontii*	Fremont cottonwood		
Quercus agrifolia	coast live oak		
Quercus douglasii	blue oak		
Quercus lobata	valley oak		
Quercus suber	cork oak		
Quercus wislizeni	interior live oak		
Raphanus raphanistrum	jointed charlock		
Raphanus sativus	wild radish		Limited
Robinia psuedoacacia	black locust		
Rosa californica	California wild rose		
Rubus discolor	Himalayan blackberry		High
Rubus ursinus	California blackberry		
Rumex crispus	curly dock		
Salix exigua	sandbar willow		
Salix gooddingii	Goodding's black willow		
Salix lasiolepis	arroyo willow		
Salsola tragus	Russian thistle		Limited
Sambucus mexicana	blue elderberry		
Scirpus sp.	bulrush		
Senecio vulgaris	old-man-of-spring		
Sequoia sempervirens	coast redwood		
Schinus sp.	pepper tree		Limited
Scirpus acutus	tule		
Silybum marianum	milk-thistle		Limited
Sonchus asper	prickly sow thistle		
Sonchus oleraceus	common sow thistle		
Sorghum halepense	Johnsongrass		
Torilis arvensis	hedge-parsley		Moderate
Toxicodendron diversilobum	poison oak		
Tragopogon sp.	salsify		
Trifolium hirtum	rose clover		Moderate
Typha sp.	cattail		Moderate
Ulmus parvifolia	Chinese elm		
Verbena bonariensis	purpletop vervain		
Vicia villosa ssp. *varia.*	winter vetch		
Vitis californica	California wild grape		
Vulpia myuros var. *myuros*	rattail fescue		Moderate
Xanthium strumarium	rough cocklebur

Appendix G

U.S. Fish and Wildlife Service List of Endangered, Threatened, and Proposed Species for the Study Area—February 4, 2008

Federal Endangered and Threatened Species that Occur in or may be Affected by Projects in the Counties and/or U.S.G.S. 7 1/2 Minute Quads you requested

Document Number: 080204015402

Database Last Updated: January 31, 2008

Quad Lists

Listed Species

Invertebrates

Branchinecta lynchi
vernal pool fairy shrimp (T)

Desmocerus californicus dimorphus
valley elderberry longhorn beetle (T)

Lepidurus packardi
vernal pool tadpole shrimp (E)

Fish

Acipenser medirostris
green sturgeon (T) (NMFS)

Hypomesus transpacificus
Critical habitat, delta smelt (X)
delta smelt (T)

Oncorhynchus mykiss
Central Valley steelhead (T) (NMFS)
Critical habitat, Central Valley steelhead (X) (NMFS)

Oncorhynchus tshawytscha
Central Valley spring-run chinook salmon (T) (NMFS)
Critical Habitat, Central Valley spring-run chinook (X) (NMFS)
Critical habitat, winter-run chinook salmon (X) (NMFS)
winter-run chinook salmon, Sacramento River (E) (NMFS)

Amphibians

Ambystoma californiense
California tiger salamander, central population (T)

Rana aurora draytonii
California red-legged frog (T)

Reptiles

Thamnophis gigas
giant garter snake (T)

Quads Containing Listed, Proposed or Candidate Species:

SACRAMENTO WEST (513D)

County Lists

Yolo County

Listed Species

Invertebrates

Branchinecta conservatio
Conservancy fairy shrimp (E)

Branchinecta lynchi
vernal pool fairy shrimp (T)

Desmocerus californicus dimorphus
valley elderberry longhorn beetle (T)

Lepidurus packardi
Critical habitat, vernal pool tadpole shrimp (X)
vernal pool tadpole shrimp (E)

Fish

Acipenser medirostris
green sturgeon (T) (NMFS)

Hypomesus transpacificus
Critical habitat, delta smelt (X)
delta smelt (T)

Oncorhynchus mykiss
Central Valley steelhead (T) (NMFS)
Critical habitat, Central Valley steelhead (X) (NMFS)

Oncorhynchus tshawytscha
Central Valley spring-run chinook salmon (T) (NMFS)
Critical Habitat, Central Valley spring-run chinook (X) (NMFS)
Critical habitat, winter-run chinook salmon (X) (NMFS)
winter-run chinook salmon, Sacramento River (E) (NMFS)

Amphibians

Ambystoma californiense
California tiger salamander, central population (T)
Critical habitat, CA tiger salamander, central population (X)

Rana aurora draytonii
California red-legged frog (T)

Reptiles

Thamnophis gigas
giant garter snake (T)

Birds

Strix occidentalis caurina
northern spotted owl (T)

Plants

Cordylanthus palmatus
palmate-bracted bird's-beak (E)

Neostapfia colusana
Colusa grass (T)
Critical habitat, Colusa grass (X)

Tuctoria mucronata
Critical habitat, Solano grass (=Crampton's tuctoria) (X)
Solano grass (=Crampton's tuctoria) (E)

Candidate Species

Birds

Coccyzus americanus occidentalis
Western yellow-billed cuckoo (C)

Key:

(E) *Endangered* - Listed as being in danger of extinction.

(T) *Threatened* - Listed as likely to become endangered within the foreseeable future.

(P) *Proposed* - Officially proposed in the Federal Register for listing as endangered or threatened.

(NMFS) Species under the Jurisdiction of the National Oceanic & Atmospheric Administration Fisheries Service. Consult with them directly about these species.

Critical Habitat - Area essential to the conservation of a species.

(PX) *Proposed Critical Habitat* - The species is already listed. Critical habitat is being proposed for it.

(C) *Candidate* - Candidate to become a proposed species.

(V) Vacated by a court order. Not currently in effect. Being reviewed by the Service.

(X) *Critical Habitat* designated for this species

Important Information About Your Species List

How We Make Species Lists

We store information about endangered and threatened species lists by U.S. Geological Survey 7½ minute quads. The United States is divided into these quads, which are about the size of San Francisco.

The animals on your species list are ones that occur within, **or may be affected by** projects within the quads covered by the list.

- Fish and other aquatic species appear on your list if they are in the same watershed as your quad or if water use in your quad might affect them.
- Amphibians will be on the list for a quad or county if pesticides applied in that area may be carried to their habitat by air currents.
- Birds are shown regardless of whether they are resident or migratory. Relevant birds on the county list should be considered regardless of whether they appear on a quad list.

Plants

Any plants on your list are ones that have actually been observed in the area covered by the list. Plants may exist in an area without ever having been detected there. You can find out what's in the surrounding quads through the California Native Plant Society's online Inventory of Rare and Endangered Plants.

Surveying

Some of the species on your list may not be affected by your project. A trained biologist or botanist familiar with the habitat requirements of the species on your list, should determine whether they or habitats suitable for them may be affected by your project. We recommend that your surveys incluc any proposed and candidate species on your list.

For plant surveys, we recommend using the Guidelines for Conducting and Reporting Botanical Inventories. The results of your surveys should be published in any environmental documents prepa for your project.

Your Responsibilities Under the Endangered Species Act

All animals identified as listed above are fully protected under the Endangered Species Act of 1973, amended. Section 9 of the Act and its implementing regulations prohibit the take of a federally liste wildlife species. Take is defined by the Act as "to harass, harm, pursue, hunt, shoot, wound, kill, tra capture, or collect" any such animal.

> Take may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or shelter (50 CFR §17.3).

Take incidental to an otherwise lawful activity may be authorized by one of twc procedures:

- If a Federal agency is involved with the permitting, funding, or carrying out of a project that n result in take, then that agency must engage in a formal consultation with the Service.

  During formal consultation, the Federal agency, the applicant and the Service work together t avoid or minimize the impact on listed species and their habitat. Such consultation would resu in a biological opinion by the Service addressing the anticipated effect of the project on listed proposed species. The opinion may authorize a limited level of incidental take.

- If no Federal agency is involved with the project, and federally listed species may be taken as part of the project, then you, the applicant, should apply for an incidental take permit. The Service may issue such a permit if you submit a satisfactory conservation plan for the species that would be affected by your project.

  Should your survey determine that federally listed or proposed species occur in the area and a likely to be affected by the project, we recommend that you work with this office and the California Department of Fish and Game to develop a plan that minimizes the project's direct a indirect impacts to listed species and compensates for project-related loss of habitat. You shou include the plan in any environmental documents you file.

Critical Habitat

When a species is listed as endangered or threatened, areas of habitat considered essential to its conservation may be designated as critical habitat. These areas may require special management considerations or protection. They provide needed space for growth and normal behavior; food, wat air, light, other nutritional or physiological requirements; cover or shelter; and sites for breeding, reproduction, rearing of offspring, germination or seed dispersal.

Although critical habitat may be designated on private or State lands, activities on these lands are n restricted unless there is Federal involvement in the activities or direct harm to listed wildlife.

If any species has proposed or designated critical habitat within a quad, there will be a separate line for this on the species list. Boundary descriptions of the critical habitat may be found in the Federal

Register. The information is also reprinted in the Code of Federal Regulations (50 CFR 17.95). See o critical habitat page for maps.

Candidate Species

We recommend that you address impacts to candidate species. We put plants and animals on our candidate list when we have enough scientific information to eventually propose them for listing as threatened or endangered. By considering these species early in your planning process you may be able to avoid the problems that could develop if one of these candidates was listed before the end o your project.

Species of Concern

The Sacramento Fish & Wildlife Office no longer maintains a list of species of concern. However, various other agencies and organizations maintain lists of at-risk species. These lists provide essent information for land management planning and conservation efforts. More info

Wetlands

If your project will impact wetlands, riparian habitat, or other jurisdictional waters as defined by section 404 of the Clean Water Act and/or section 10 of the Rivers and Harbors Act, you will need tc obtain a permit from the U.S. Army Corps of Engineers. Impacts to wetland habitats require site specific mitigation and monitoring. For questions regarding wetlands, please contact Mark Littlefield this office at (916) 414-6580.

Updates

Our database is constantly updated as species are proposed, listed and delisted. If you address proposed and candidate species in your planning, this should not be a problem. However, we recommend that you get an updated list every 90 days. That would be May 04, 2008.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

The Map ID column refers to the Map ID-Focus Map(s) of the listed site.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

Delisted NPL: The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may deleted from the NPL where no further response is appropriate.

A review of the Delisted NPL list, as provided by EDR, and dated 08/27/2007 has revealed that there is 1 Delisted NPL site within the searched area.

Site	Address	Map ID
JIBBOOM JUNKYARD SUPERFUND SIT	***240 JIBBOOM ST***	***19-9***

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 04/23/2007 has revealed that there are 2 CERCLIS sites within the searched area.

JIBBOOM JUNKYARD SUPERFUND SIT	***240 JIBBOOM ST***	***19-9***
VAN WATERS & ROGERS, INC	850 SOUTH RIVER ROAD	60-13

EXECUTIVE SUMMARY

CERCLIS-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 06/21/2007 has revealed that there are 2 CERC-NFRAP sites within the searched area.

Site	Address	Map ID
SOUTHERN PACIFIC TRANS CO	***401 I ST***	***39-9,10,13,14***

RCRAInfo: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System(RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month Large quantity generators generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 06/13/2006 has revealed that there is 1 RCRA-TSDF site within the searched area.

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, and dated 08/28/2007 has revealed that there are 9 RESPONSE sites within the searched area.

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, and dated 12/31/2005 has revealed that there are 17 HAZNET sites within the searched area.

EXECUTIVE SUMMARY

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 08/28/2007 has revealed that there are 28 ENVIROSTOR sites within the searched area.

EDR PROPRIETARY RECORDS

EDR Manufactured Gas Plants: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the Manufactured Gas Plants list, as provided by EDR, has revealed that there are 4 Manufactured Gas Plants sites within the searched area.

Current Owner:	CITY
Current Prog:	Not reported
Future Prog:	Not reported

FUDS Description Details:

The 2.0-acre site is located 3 1/2 miles west of the City of Sacramento in West Sacramento, Yolo County, CA. The Sacramento and San Joaquin Drainage District currently own the land.

FUDS History Details:

The site was established prior to 1 January 1943 and was known as the Sacramento District Engineer Yard - Weir Area. The site was used by the Army for river and harbor purposes. On 11 August 1954, 2.0 fee acres were conveyed to the Sacramento and San n Joaquin Drainage District. There were no recapture provisions. Currently, there are no potential hazards identified at this location, further investigation is needed.

on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Comments:	Site Screening completed. A 1986 PA recommended soil sampl- ing at drum storage sites on the property. During a March 1984 inspection, the Dept. of Health Services observed one hundred drums, some of which were leaking and in very poor condition. BSITE SCREENING DONEO R was cited for Health and Safety Code violations for illegal discharge of wastes to a drainage canal that runs along the west end of the property. Soil sampling revealed zinc at levels up to 6,800 ug/g at an outfall pipe that drains into the westside canal. In January 1986 two underground storage tanks were removed under the supervision of Yolo County Dept. of Health. One tank stored petroleum products, including solvents, and the other smaller tank stored waste water. No leaks were detected from an inspection of the tanks and no contamin- ation was detected from soil samples taken from the tank excavation pits. Four other tanks have been removed since 1986. DTSC files contain no dates or removal sampling information. A Preliminary Endangerment Assessment (PEA) is required due to past waste discharges, drum leakage and high concentrations of zinc found in the drainage pipe.

33 **B.O.R. INDUSTRIES** **CA BOND EXP. PLAN** **S100833345**
2505 RICE AVENUE **N/A**
WEST SACRAMENTO, CA 95691

CA BOND EXP. PLAN:

Reponsible Party:	DETAILED SITE EXPENDITURE PLAN
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	The identified responsible party appears to be a small business with limited resources. It appears at this time that it will be necessary to utilize Bond funds to remediate this site. If Bond funds are expended, DHAS will undertake appropriate cost recovery action. This site has not been identified as an NPL site, nor does it appear to be a likely NPL candidate in the future. Therefore, it appears unlikely that federal funds are a viable source of revenue for this site.
Site Description:	B.O.R. Industries (B.O.R.) is currently registered as a hazardous waste transporter and used oil transfer facility. The facility on this two acre site has operated since approximately 1972. The previous owner operated a similar business at the same location. The current owners are Norman Bennett and Steven Bennett.
Hazardous Waste Desc:	Heavy metals are the contaminants of greatest concern. Areas of concern include: underground tanks, soils underlying cracked asphalt pavement and soils near the discharge end of the outfall pipe in an adjacent ditch. Soil samples taken in the ditch on March, 29, 1984, indicated elevated levels of lead, zinc and copper.
Threat To Public Health & Env:	Because of the high water table in this area (25 feet from the surface) and the direct discharge of waste to surface soils, ground water degradation is the major concern. The immediate area depends on ground water for drinking and irrigation uses. This includes the Cities of Bryte, Broderick and West Sacramento. Also of concern is the proximity of the site to an irrigation canal. The site is fenced and locked when unattended.
Site Activity Status:	In August 1984, the Yolo County Municipal Court found B.O.R. in violation of the Health and Safety Code for recycling used oil and storage of used oil and other hazardous wastes. A preliminary assessment has been completed. DHS is projecting to use State Bond funds to perform the remedial investigations and subsequent work.

California - Hazardous Waste Tracking System - Datamart

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Summary Details:

Conditions at listing December 1982): The Jibboom Junkyard covers 9 acres in Sacramento, California, on the floodplain of the Sacramento River. A metal-salvaging business operated on the site. Among other things, the company dismantled transformers and possibly asbestos-lined boilers. The original si e of the site is unknown, but it may once have covered about 35 acres. Portions of the original site are now occupied by motels and/or are a part of Interstate Freeway I-5.Soil sampling by the State in 1981 detected levels of heavy metals exceeding the State s Total Threshold Limit Concentrations. There were also indications of PCB contamination. The soil is highly permeable, and the aquifer is 35 feet below thesurface. The city s drinking water is taken from the river at the northwest corner of the site. The river is also used for recreation and irrigation. Status July 1983): In April 1983, EPA collected soil samples, and in May 1983 the State fenced the site to limit public access. In June 1983, deep core samples were collected to further determine the extent and nature of contamination on the site.

Comments:	The RI/FS approved.An interagency agreement was completed for oversight of 5-year review of remedial action.A Voluntary Cleanup Agreement was executed on September 9, 2002 for oversight of installation of two underground utilities. The water main extension and sewer extension will be constructed above the existing protective earthen clay cap and in a manResponse activities included the capping of approx. 1.5 acres, including the building. Capping involved backfill to grade. Cap includes two feet of compacted clay and one foot of soil topcover.Agreement was signed for the continued operation and monitoring of the constructed soil cap remedy, groundwater monitoring system, and existing building and fence.DTSC signed an Interagency Agreement with DWR to complete the RI/FS, RAP and Certification of the site under the Voluntary Cleanup Program.The PEA was completed on April 30 ,1992. Further action is required to remove contaminated soils and to further investigate ground water.A CEQA Final Negative Declaration and Notice of Determination for the remedial action at this site dated Dec. 16, 1996 was completed.The site is certified complete. The remedial actions required by the 12/17/97 RAP include a clay and earth cap over lead contaminated soil, a deed restriction limiting property from unrestricted uses, an operations and maintenance plan, and agreemeApprox 0.75 acres have been capped and 2.5 acres released for reuse-commercial/industrial use only. Both the Remedial Action Plan (RAP) and Design (DES) have been approved.A deed restriction was recorded on a surveyed portion of the site prohibiting anyone in possession of the property from certain uses of the property including a residence, hospital, school, or day care center without a variance. Actions that wouldnt to maintain the remedy.ner protective of current and future public health and safety.interfere with the integrity of the hazardous waste containment unit or monitoring system are prohibited without a variance.

I-5 AND JIBBOOM STREET **N/A**
SACRAMENTO, CA 95814

CA BOND EXP. PLAN:

Reponsible Party:	NPL SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	The site is on the NPL and remedial actions are jointly funded by the State (10 percent) and federal (90 percent) governments. Bond monies were used to fund the State's share of the remedial action. The State and federal governments will seek cost recovery from any identified responsible parties.
Site Description:	This is a former junkyard/transformer salvage yard. It is on the Sacramento River south of the confluence with the American River.
Hazardous Waste Desc:	Polychlorinated biphenyls (PCBs), lead, copper, zinc and asbestos were found in soils at this site.
Threat To Public Health & Env:	People coming in direct contact with contaminated soils from the site were the population at risk. The routes of exposure were dermal, inhalation, and ingestion. Approximately 11,000 cubic yards of contaminated soil were removed from this 2.3 acre site. The depth of excavation ranged from 1 foot to 30 feet below grade.
Site Activity Status:	A draft feasibility study prepared under an EPA contract, was submitted in February, 1985. The final design analysis was completed in July, 1985. Remedial action was completed in May, 1987. The site is pending certification by EPA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

401 "I" STREET **N/A**
SACRAMENTO, CA 95814

CA BOND EXP. PLAN:

Reponsible Party:	RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Denver and Rio Grande Railroad
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Denver, CO
Project Revenue Source Desc:	The Department has budgeted $100,000 for oversight activities. The RP has agreed in the enforceable agreement to pay DHS oversight costs on a quarterly basis. The responsible parties will pay all costs associated with cleanup.
Site Description:	This is an old locomotive works for the cleaning and refurbishing of coal and diesel engines and railcars. The works were established in 1865.
Hazardous Waste Desc:	Known contaminants in shallow ground water include heavy metals, petroleum hydrocarbons, inorganic solvents and organic solvents. Lead is a heavy metal of particular concern. Benzene is a likely petroleum hydrocarbon contaminant. Kerosene is a likely organic solvent contaminant. Another organic solvent likely to have contaminated the site is 1,1,1-trichloroethane.
Threat To Public Health & Env:	Potential pathways of exposure include ingestion, inhalation and dermal contact. Potential receptors include humans, mammals, birds and freshwater fish. The site is located within one half mile of the Sacramento and American Rivers. Shallow ground water flow is predominantly to the East. Wells serving Bannon Street residents have been tested for organics and metals. Results showed all wells to be uncontaminated by organics and metals.
Site Activity Status:	An enforceable agreement has been implemented between DHS and the RP. A scoping document has been submitted by the RP. A work plan and schedule for investigation and cleanup was submitted October, 1988. A number of underground tanks have already been removed and have received closure approval by the RWQCB.

California - Hazardous Waste Tracking System - Datamart

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo Corrective Action Summary:

Event:	Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.
Event Date:	01/09/2004
Event:	Igration of Contaminated Groundwater under Control, More information is needed to make a determination.
Event Date:	01/10/2001
Event:	Current Human Exposures under Control, Current human exposures are NOT under control.
Event Date:	01/10/2001
Event:	Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Comments:	DES/RDIP -- DESIGN/REMEDIAL DESIGN IMPLEMENTATION PLAN. THE LAGOON STUDY AREA (LSA) IS APPROXIMATELY 434 ACRES OF THE 240 ACRE FORMER SPTCO RAIL YARD LOCATED IN DOWNTOWN SACRAMENTO. THE LSA WAS UTILIZED FOR AS AN INDUSTRIAL WASTEWATER LAGOON, OIL/CEQA/NOD--An NOD was approved for actions selected under a Remedial Action Plan Amendment prepared for soil remediation of an 11 acre Northwestern portion of the Lagoon Study Area. DTSC prepared an Initial Study Agency Checklist which relies on theCEQA - The DTSC issued the Notice of Determination for the Lagoon Study Area Final RAP, approved remedial alternative on December 30, 1999.CEQA/NOD - The DTSC approved the Notice of Determination for the LSA Final Amended (FARAP) for Soil, and the NSSA, CSNSA, and CCSA Final Remedial Action Plan (FRAP) for Soil.Implementation Plan ApprovedAsbestos Contingency PlanThe 7th Street Corridor deed restriction prohibits land uses including residental, hospital, public or private schools for persons uncer 18 years of age, day care centers, raising of food, drilling for water, and extraction of groundwater. No activFinal Amended RAP approved for soilRAP -- DTSC APPROVED THE FINAL RAP, DATED 12/28/98, APPROVED 12/30/98, FOR THE LSA 51 ACRES OF THE 240-ACRE SPTCO-SACRAMENTO RAILYARD SITE. THE APPROVED ALTERNATIVE FOR REMEDIATION FOR THE 239,640 CUBIC YARDS OF CONTAMINATED SOILS IDENTIFIED IN THERIFS -- Soil FS approved. LSA represents 51 acres of the 240 acre SPTCo-Sacramento Rail Yard. The approved RIFS has initially identified 51,965 cubic yards of contaminated soils that will require offsite disposal and 187,675 cubic yards of contamRA (LSARA) -- The Interim Remedial Measure (IRM) is being implemented for remediation of soil contaminated with Volatile Organic Compounds (VOC's), Semi-Volatile Organic Compounds (SVOC's), and metals from operation and maintenance activities at thCEQA/NOE--DTSC prepared a Notice of Exemption (NOE) for an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine, and

Map ID	Site	Database(s)	EPA ID Number

UP, DOWNTOWN SAC - LAGOON (Continued) **S105954434**

Northern ShopRAP/NWLSA--DTSC approved a RAP amendment for soil cleanup of an 11 acre portion of the Lagoon Study Area (LSA) of the railyard site. The Amendment to the 2000 Final Amended Industrial Wastewater Lagoon Remedial Action Plan for Soil changes the remeDES - The DTSC approved the Final Remediation Design and Implementation Report (RDIP) for Soil on May 22, 2000, for the Lagoon Study Area, 51 acres of the 240 acre SPTCo - Sacramento Rail Yard Site. The approved RDIP for remediation for the 239,640RAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishes the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was held from February 25 throughities are allowed that will disturb the soil without a soils management plan and health and safety plan and contaminated soils brought to the surface shall be managed in accordance with all applicable state and federal laws. The deed restriction acubic yards of contaminated soils consists of excavation, ex-situ vapor extraction, chemical stabilization and, off-site disposal. Imple-mentation of the RDIP is scheduled to begin in May of 2000, and to continue through October of 2005. The prelimCity of Sacramento EIRs prepared for redevelopment projects which includes the Railyard. The NOD and supporting evaluations were made available for public review for 30 days from 2/25/03 to 3/27/03 and was presented at the 3/11/03 public meeting hes RAP for Soil. The ACP establishes the process to identify the presence of and safely clean up asbestos if found during future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/e SPTCo-Sacramento Rail Yard. The IRM consists of excavation remediation of approximately 2500 cubic yards of contaminated soils from the Industrial Waste Water Lagoon. The contaminated soil will be stockpiled and treated at the Drum Storage Areainated soils that will be disposed of onsite. The onsite disposal alternative includes design and construction of an onsite 450,000 cubic yard solid waste landfill, primarily designed for relatively intert metals contaminated soils. The landfill wRAP IS EXCAVATION, EX-SITU VAPOR EXTRACTION, CHEMICAL STABILIZATION, ONSITE SECURE CONTAINMENT AND OFFSITE DISPOSAL. THE ONSITE DISPOSAL ALTERNATIVE INCLUDES DESIGN AND CONSTRUCTION OF AN ONSITE, 450,000 CUBIC YARD SOLD WASTE LANDFILL, PRIMARILY DESWATER SEPERATOR OVERFLOW AREA, AND FORMER LOCATION OF A 50,000 GALLON OIL STORAGE TANK. THE RDIP 2004 PROVIDES FOR EXCAVATIONS, STORAGE, TREATMENT, AND OFFSITE DISPOSAL OF APPROXIMATELY 120,000 CUBIC YARDS OF SOIL CONTAMINATED VOLATILE ORGANIC COMPOdy for the northwestern corner of the LSA from excavation and offsite disposal to grading and capping with an engineered paved cover. Land use will be limited under a deed restriction. In compliance with CEQA, DTSC has prepared a Notice of DeterminIGNED FOR RELATIVELY INERT METALS CONTAMINATED SOILS. THE LANDFILL WILL BE DESIGNED AND CONSTRUCTED AS A CLASS II LANDFILL. THE ONSITE LANDFILL HAS BEEN APPROVED WITH THE FOLLOWING REQUIREMENTS: NO LIQUIDS MAY BE DISPOSED ONSITE, ALL METAL CONTAMINAMarch 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.ld at the Sacramento Amtrak Depot. A notice was displayed in the Sacramento Bee newspaper and a fact sheet was mailed to the site

UP, DOWNTOWN SAC - LAGOON (Continued) **S105954434**

mailing list to provide information and announce the review period and a public meeting.03. Public comments were received by DTSC and addressed through a responsiveness summary.ill be designed and constucted as a Class II landfill. The onsite landfill has been approved with the following requirements: no liquids may be disposed of onsite, all metal contaminated soils with organics may only be placed in the landfill if thinary costs of the remediation is estimated to be $17,115,480.UNDS SVOCs, AND TOTAL PETROLEUM HYDROCARBON (TPH) IN THE LAGOON STUDY AREA, AND CENTRAL CORRIDOR STUDY AREA, AND CAR SHOP NINE STUDY AREA FOR WHICH REMEDIAL ACTION PLANS (RAPs) HAVE BEEN PREVIOUSLY APPROVED.lso allows access for the Department for monitoring, inspection, and other activities.(DSA utilizing the existing DSA soil vapor extraction and treatme system to remediate VOC contamination. The VOC remediated soils will then be chemically stabilized/solidified to treat SVOC and metal contamination. The remediated/stabilized soil wation (NOD) for this project. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.ill then be disposed of at the ECDC Utah Landfill.TED SOILS WITH ORGANICS MAY ONLY BE PLACED IN THE LANDFILL IF THE ORGANIC CONSTITUENTS ARE ALL LESS THAN THRESHOLD VALUES, NO RCRA WASTES, AND NO CALIFORNIA HAZARDOUS WASTE THAT HAS NOT BEEN CLASSIFIED AS DESIGNATED WASTE. IMPLEMENTATION OF THE SELe organic constituents are all less than threshold values, no RCRA waste, and no California Hazardous Waste that has not been classified as designated waste. The preliminary cost of the proposed alternative, Alternative H, is $20,315,000. The final RAP is scheduled for completion in September 1998.ECTED ALTERNATIVE IS SCHEDULED TO BEGIN IN APRIL OF 2000 AND TO CONTINU THROUGH OCTOBER OF 2005. THE PRELIMINARY COST OF THE PROPOSED ALTERNATIVE IS EXTIMATED TO BE $20,315,000.

UP, DOWNTOWN SAC - LAGOON (Continued) **S105954434**

FOR AS AN INDUSTRIAL WASTEWATER LAGOON, OIL/CEQA/NOD--An NOD was approved for actions selected under a Remedial Action Plan Amendment prepared for soil remediation of an 11 acre Northwestern portion of the Lagoon Study Area. DTSC prepared an Initial Study Agency Checklist which relies on theCEQA - The DTSC issued the Notice of Determination for the Lagoon Study Area Final RAP, approved remedial alternative on December 30, 1999.CEQA/NOD - The DTSC approved the Notice of Determination for the LSA Final Amended (FARAP) for Soil, and the NSSA, CSNSA, and CCSA Final Remedial Action Plan (FRAP) for Soil.Implementation Plan ApprovedAsbestos Contingency PlanThe 7th Street Corridor deed restriction prohibits land uses including residental, hospital, public or private schools for persons uncer 18 years of age, day care centers, raising of food, drilling for water, and extraction of groundwater. No activFinal Amended RAP approved for soilRAP -- DTSC APPROVED THE FINAL RAP, DATED 12/28/98, APPROVED 12/30/98, FOR THE LSA 51 ACRES OF THE 240-ACRE SPTCO-SACRAMENTO RAILYARD SITE. THE APPROVED ALTERNATIVE FOR REMEDIATION FOR THE 239,640 CUBIC YARDS OF CONTAMINATED SOILS IDENTIFIED IN THERIFS -- Soil FS approved. LSA represents 51 acres of the 240 acre SPTCo-Sacramento Rail Yard. The approved RIFS has initially identified 51,965 cubic yards of contaminated soils that will require offsite disposal and 187,675 cubic yards of contamRA (LSARA) -- The Interim Remedial Measure (IRM) is being implemented for remediation of soil contaminated with Volatile Organic Compounds (VOC's), Semi-Volatile Organic Compounds (SVOC's), and metals from operation and maintenance activities at thCEQA/NOE--DTSC prepared a Notice of Exemption (NOE) for an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine, and Northern ShopRAP/NWLSA--DTSC approved a RAP amendment for soil cleanup of an 11 acre portion of the Lagoon Study Area (LSA) of the railyard site. The Amendment to the 2000 Final Amended Industrial Wastewater Lagoon Remedial Action Plan for Soil changes the remeDES - The DTSC approved the Final Remediation Design and Implementation Report (RDIP) for Soil on May 22, 2000, for the Lagoon Study Area, 51 acres of the 240 acre SPTCo - Sacramento Rail Yard Site. The approved RDIP for remediation for the 239,640RAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishes the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was held from February 25 throughities are allowed that will disturb the soil without a soils management plan and health and safety plan and contaminated soils brought to the surface shall be managed in accordance with all applicable state and federal laws. The deed restriction acubic yards of contaminated soils consists of excavation, ex-situ vapor extraction, chemical stabilization and, off-site disposal. Imple-mentation of the RDIP is scheduled to begin in May of 2000, and to continue through October of 2005. The prelimCity of Sacramento EIRs prepared for redevelopment projects which includes the Railyard. The NOD and supporting evaluations were made available for public review for 30 days from 2/25/03 to 3/27/03 and was presented at the 3/11/03 public meeting hes RAP for Soil. The ACP establishes the process to identify the presence of and safely clean up asbestos if found during

Map ID	Site	Database(s)	EPA ID Number

UP, DOWNTOWN SAC - LAGOON (Continued) **S105954434**

future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/e SPTCo-Sacramento Rail Yard. The IRM consists of excavation remediation of approximately 2500 cubic yards of contaminated soils from the Industrial Waste Water Lagoon. The contaminated soil will be stockpiled and treated at the Drum Storage Areainated soils that will be disposed of onsite. The onsite disposal alternative includes design and construction of an onsite 450,000 cubic yard solid waste landfill, primarily designed for relatively intert metals contaminated soils. The landfill wRAP IS EXCAVATION, EX-SITU VAPOR EXTRACTION, CHEMICAL STABILIZATION, ONSITE SECURE CONTAINMENT AND OFFSITE DISPOSAL. THE ONSITE DISPOSAL ALTERNATIVE INCLUDES DESIGN AND CONSTRUCTION OF AN ONSITE, 450,000 CUBIC YARD SOLD WASTE LANDFILL, PRIMARILY DESWATER SEPERATOR OVERFLOW AREA, AND FORMER LOCATION OF A 50,000 GALLON OIL STORAGE TANK. THE RDIP 2004 PROVIDES FOR EXCAVATIONS, STORAGE, TREATMENT, AND OFFSITE DISPOSAL OF APPROXIMATELY 120,000 CUBIC YARDS OF SOIL CONTAMINATED VOLATILE ORGANIC COMPOdy for the northwestern corner of the LSA from excavation and offsite disposal to grading and capping with an engineered paved cover. Land use will be limited under a deed restriction. In compliance with CEQA, DTSC has prepared a Notice of DeterminIGNED FOR RELATIVELY INERT METALS CONTAMINATED SOILS. THE LANDFILL WILL BE DESIGNED AND CONSTRUCTED AS A CLASS II LANDFILL. THE ONSITE LANDFILL HAS BEEN APPROVED WITH THE FOLLOWING REQUIREMENTS: NO LIQUIDS MAY BE DISPOSED ONSITE, ALL METAL CONTAMINAMarch 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.ld at the Sacramento Amtrak Depot. A notice was displayed in the Sacramento Bee newspaper and a fact sheet was mailed to the site mailing list to provide information and announce the review period and a public meeting.03. Public comments were received by DTSC and addressed through a responsiveness summary.ill be designed and constucted as a Class II landfill. The onsite landfill has been approved with the following requirements: no liquids may be disposed of onsite, all metal contaminated soils with organics may only be placed in the landfill if thinary costs of the remediation is estimated to be $17,115,480.UNDS SVOCs, AND TOTAL PETROLEUM HYDROCARBON (TPH) IN THE LAGOON STUDY AREA, AND CENTRAL CORRIDOR STUDY AREA, AND CAR SHOP NINE STUDY AREA FOR WHICH REMEDIAL ACTION PLANS (RAPs) HAVE BEEN PREVIOUSLY APPROVED.lso allows access for the Department for monitoring, inspection, and other activities.(DSA utilizing the existing DSA soil vapor extraction and treatme system to remediate VOC contamination. 39 **SP, SAC. - BATTERY SHOP** **CA BOND EXP. PLAN** **S100833177**
401 "I" STREET **N/A**
SACRAMENTO, CA 95814

CA BOND EXP. PLAN:

Reponsible Party:	RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Denver and Rio Grande Railroad/Southern Pacific Transportation Co.
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Denver/San Francisco, CO/CA
Project Revenue Source Desc:	The Department has budgeted $50,000 for oversight of the responsible parties cleanup activities. The RP has agreed to pay DHS oversight costs in the enforceable agreement on a quarterly basis. The responsible parties will pay all costs associated with cleanup.
Site Description:	The site encompasses three RCRA sites under one Court Order. The Court Order time schedule was included in an Enforceable Agreement dated June 2, 1988. These entail (a) a battery storage and disposal area (including dry well disposal), (b) a 2000 square foot drum storage area (containing solvents) and (c) a grit blast waste pile area (containing over 3100 cubic yards of sand).
Hazardous Waste Desc:	Contaminants include (a) copper, lead and petroleum hydrocarbons at the grit blast area, (b) lead and acids at the battery storage and disposal area, and (c) lead and organic compounds at the drum storage area.
Threat To Public Health & Env:	Potential pathways of exposure include ingestion, inhalation and dermal contact at all three locations. Potential receptors include humans, mammals, birds and freshwater fish. The site is within one half mile of the Sacramento and American Rivers, and seasonal fluctuation of shallow ground water direction has been confirmed.
Site Activity Status:	A third round of soil and ground water sampling was completed in September, 1988. Results from these investigations will be used to modify the analysis of remedial alternatives presented in March, 1988. A Court Order was signed July 30, 1987. The Order set a time schedule for a combined RAP/RCRA Closure. The time schedule in the Court Order was included in an enforceable agreement with DHS dated June 2, 1988. As an interim remedial measure it is proposed to centralize contaminated soils from the Battery Shop, Drum Storage and Sand Pile sites. Stockpiled wastes will be tarped. Drainage will also be collected down slope. Wastes will be stockpiled above visqueen to prevent percolation.

39 **SP, SAC. - PONDS & DITCH** **CA BOND EXP. PLAN** **S100833178**
401 "I" STREET **N/A**
SACRAMENTO, CA 95814

CA BOND EXP. PLAN:

Reponsible Party:	RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Southern Pacific Transportation Company/Denver and Rio Grande Railroad
Project Revenue Source Addr:	Southern Pacific Building, 1 Market Plaza
Project Revenue Source City,St,Zip:	San Francisco/Denver, CA/CO 94105
Project Revenue Source Desc:	DHS has budgeted $50,000 for oversight activities. The RP has agreed to pay DHS oversight costs in the enforceable agreement on a quarterly basis. The responsible parties will pay all costs associated with cleanup.
Site Description:	Industrial waste water disposal ponds and an industrial waste water conveyance ditch are the focal points of this site investigation. A RAP/RCRA closure is required.
Hazardous Waste Desc:	Sludge and soil samples analyzed contained high concentrations of copper, lead, zinc, 1,1,1-trichloroethane, trichloroethane, tetrachloroethene, naphthalene, and bis (2-ethylhexyl) phthalate. Ground water contaminants include chromium, methylene chloride, 1,1-dichloroethane (ethylene chloride), and trans-acetylene dichloride (trans-1,2-dichloroethane).
Threat To Public Health & Env:	Potential pathways of exposure include ingestion, inhalation and dermal contact. Potential receptors include humans, mammals, birds, insects, freshwater fish, nematodes, soil bacteria and grasses common to the Central Valley. The City of Sacramento has a domestic water intake from the Sacramento River located approximately one mile north of the site. Ground water is used by the State Printing Plant and Crystal Dairy for industrial purposes just north of the site. Wells serving Bannon Street residents have been tested for organics, metals and coliform organisms. Results showed all wells uncontaminated by organics and metals.
Site Activity Status:	Sludge from both the ponds and ditch was excavated and disposed of at a Class I landfill in 1984 and 1985 as IRMs. Three rounds of remedial investigation have been completed at the ponds and ditch, the most recent in May, 1987. Bench scale testing of soil solidification and soil washing is now underway. Until a final design is approved, the extraction well near the ponds and ditch has been turned off. A final feasibility study (FS) was received in October, 1988.

This additional evaluation will be included in the Feassistent with RDIP approved for soil remediation activities.il Yard off-site to the south, the South Plume. The CEQA package project is implementation of two Interim Remedial Measures (IRMs), the South Plume Source Control and the South Plume Margin Control. The South Plume Margin Control consists of a groving the freight track. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comment were received by DTSC and addressed through a responsiveness summary.ibility Study as part of the development of remedial goals for soil and groundwater. The future evaluation of VOCs will include all applicable exposure pathways including indoor air.oundwater extraction system located on P Street in Sacramento for leading edge capture. The South Plume Source Control consists of a groundwater/soil vapor extraction and treatment system located within the SPTCo-Sacramento Rail Yard to capture identified sources. Removal Action Work Plan (RAW) Groundwater Removal Action (GWRA) -- A Removal Action Workplan was approved for two South Plume Margin Control. The South Plume Margin Control consists of a groundwater extraction system located onP Street in Sacramento. The South Plume Source Control is comprised of a groundwater/soil vapor extraction and treatment system located within the Central Shops Study area of the SPTCo-Sacramento Rail Yard. The Interim Remedial Measures (IRMs) arebeing implemented to control the lateral and veritcal migration of groundwater contaminated with volatile organic compounds. The groundwater extraction system became operational on May 12, 2001.

Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine, and Northern ShopFRA (DSVS1) and FRA (DSGW) -- The groundwater extraction and treatment and soil vapor extraction and treatment systems have been constructed at the former drum storage area facility. Normal operation of the systems began 09/15/1994.RAP - The DTSC approved the Final RAP, dated February 14, 2000, for the Northern Shops Study Area, which consists of 35 acres of the 240 acre SPTCo-Sacramento Rail Yard Site. The approved alternative for remediation for the 180,650 cubic yards of cAsbestos Contingiency PlanDrum Storage Area Groundwater Treatment System Construction completedRAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishORDER (DOS&M) -- An Enforceable Agreement was completed for the Operation and Maintenance of the groundwater and vapor extraction systems at the former drum storage area facility.Notice of Determinationes the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was held from February 25 throughontaminated soils identified the RAP is excavation, land farming, chemical stabilization and, off-site disposal. Implementation of the selected alternative is schedule to begin in May of 2000 and to continue through October of 2005. The preliminarys RAP for Soil. The ACP establishes the process to identify the presence of and safely clean up asbestos if found during future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/cost of the proposed alternative is estimated to be $14,353,374. CEQA/NOD - The DTSC approved the Notice of Determination for the LSA Final Amended (FARAP), and the NSSA, CSNSA, and CCSA Final Remedial Action Plan (FRAP) on February 16, 2000.March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.03. Public comments were received by DTSC and addressed through a responsiveness summary.

Shop Nine, and Northern ShopDES - The DTSC approved the Final Remediation Design and Imple- mentation Report (RDIP) on May 22, 2000, for the Car Shop Nine Study Area, 40 acres of the 240 acre SPTCo - Sacramento Rail Yard Site. The approved RDIP is for the 132,718 cubic yardsRAP - The DTSC approved the Final RAP, for the Car Shop Nine Study Area, which consists of 40 acres of the 240 acre SPTCo- Sacramento Rail Yard site. The approved alternative for approved alternative for remediation for the 132,718 cubic yards of coRAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishThe 7th Street Corridor deed restriction prohibits land uses including residental, hospital, public or private schools for persons uncer 18 years of age, day care centers, raising of food, drilling for water, and extraction of groundwater. No activities are allowed that will disturb the soil without a soils management plan and health and safety plan and contaminated soils brought to the surface shall be managed in accordance with all applicable state and federal laws. The deed restriction as RAP for Soil. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary. The ACP establof contaminated soils consists of excavation, land farming, chemical stabilization and, off-site disposal. Implementation of the RDIP is scheduled to begin in May of 2000, and to continue through October of 2005. The preliminary costs of the propoithin the Lagoon Groundwater and Central Shops South Plume RI/FS and RAP. The CSNSA was utilized for constructing rail cars, painting rail cars, sandblasting, general offices and railyard operations buildings. Additionally, five Underground StorageCARS; SANDBLASTING; GENERAL OFFICES; AND RAIL YARD OPERATIONS. THE RDIP 2004 PROVIDES FOR EXCAVATIONS, STORAGE, TREATMENT, AND OFFSITE DISPOSAL OF APPROXIMATELY 120,000 CUBIC YARDS OF SOIL CONTAMINATED VOLATILE ORGANIC COMPOUNDS (VOCs), SVOC, AND Tntaminated soils identified in the RAP is excavation, land farming, chemical stabilization and off-site disposal. Implementation of selected alternative is scheduled to being in May of 2000 and to continue through October of 2005. The preliminary ces the process to identify the presence of and safety clean up of asbestos if found during future soil excavation.ost of the proposed alternative is estimated to be $8,050,957. CEQA/NOD -sed alternative is estimated to be 8,050,957.Tanks were located at the CSNSA. During Phase I characterization, soil gas samples were collected from 11 locations, 31 soil borings were drilled and sampled, andgroundwater samples were collected from 24 locations. During Phase II, the final PhaseOTAL PETROLEUM HYDROCARBON (TPH) IN THE CAR SHOP NINE STUDY AREA, LAGOON STUDY AREA, AND CENTRAL CORRIDOR STUDY AREA FOR WHICH REMEDIAL ACTION PLANS (RAPs) HAVE BEEN PREVIOUSLY APPROVED.lso allows access for the Department for monitoring, inspection, and other activities.ishes the process to identify the presence of and safely clean up asbestos if found during future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/03. Public comments were recei25 additional soil borings were drilled. Compounds of concern (COC'S) detected in the soil included VOC'S-VC and TCE, SVOC'S-PNA'S, Anthracene and Chrysene, TPH-#2 and #6 fuel oil, oil and grease and extractable and

Final Amended RAP(FARAP), and the NSSA, CSNSA, and CCSA Final Remedial Action Plan (FRAP) on February 16, 2000.RAP - ESD -- The Department has approved an Explanation of Significant Differences (ESD) on 4/17/02 to permit soil bioremediation treatment on-site. Soil remediation strategies approved under the site Remedial Action Plans (RAP) includes excavationCEQA - NOD -- The Department approved an Explanation of Significant Differences (ESD) on 4/17/02 to permit soil bioremediation treatment on-site. To meet the requirements of the California Environmental Quality Act, DTSC, in its role as the Lead AgeDES - The DTSC approved the Final Remediation Design and Implementation Report (RDIP) on May 22, 2000, for the Central Corridor Study Area, 29 acres of the 240 acre SPTCo - Sacramento Rail Yard Site. The approved RDIP for remediation for the 98,888RAP - The DTSC approved the Final RAP for the Central Corridor Study Area which consists of 29 acts of the 240 acre Southern Pacific Transportation-Sacramento Rail Yard Site. The approved alternative for remediation for the 98,888 cubic yards of cRAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishCEQA/NOE--DTSC prepared a Notice of Exemption (NOE) for an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine, and Northern ShopRI/FS - The Union Pacific Railroad Company has completed soil characterization of the former Southern Pacific Transportation Company - Sacramento Railyard, Central Corridor Study Area (CCSA). Groundwater contamination for the CCSA will be addressedDES/RDIP -- DESIGN/REMEDIAL DESIGN IMPLEMENTATION PLAN. THE CAR SHOP NINE STUDY AREA (CSSA) IS APPROXIMATELY 35 ACRES OF THE 240 ACRE FORMER SPTCO RAIL YARD LOCATED IN DOWNTOWN SACRAMENTO. THE CSSA WAS UTILIZED FOR BOXCAR CLEANING DISMANTLING AND Sncy for the soil remediation of the site, has considered the Environmental Impact Reports prepared for and certified by the City of Sacramento (City). DTSC has determined that the EIRs and supporting documents relied on for approval of the site soils RAP for Soil. The ACP establishes the process to identify the presence of and safely clean up asbestos if found during future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/cubic yards of contaminated soils consists of excavation, land farming, chemical stabilization and, off-site disposal. Implementation of the RDIP is scheduled to begin in May of 2000, and to continue through October of 2005. The preliminary costsANDBLASTING. A SAWMILL WAS UTILIZED FOR LUMBER MILLING, PLAINING, AND WOODWORKING. THE RDIP 2004 PROVIDES FOR EXCAVATION, STORAGE, TREATMENT, AND OFFSITE DISPOSAL OF APPROXIMATELY 120,000 CUBIC YARDS OF SOIL CONTAMINATED WITH VOLATILE ORGANIC COMPwithin the Lagoon groundwater and Central Shops/South Plume Remedial Investigation/Feasibility Study (RI/FS) and Remedial Action Plan (RAP). The CCSA was utilized for boxcar cleaning and dismantiling, sandblasting, general offices, and a sawmill. Aof impacted soil, treating certain soil prior to reuse or disposal, and loading all waste soil for off-site disposal to a landfill.
Treatment options approved under the RAP did not specifically include bioremediation of soil. The enclosed ESD hases the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was

Design Report provides detailed plumbing and electrical plans and provides discharge requirements from the City of Sacramento and tres RAP for Soil. The ACP establishes the process to identify the presence of and safely clean up asbestos if found during future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/03.e required with at least two additional extraction wells and predischarge treatment to reduce contaminant concentrations to levels acceptable for discharge to the city of Sacramento sewer system for treatment at the publicly owned treatment works.backfilling an area of excavation, a post-remediation health risk assessment was required. The recently approved assessment has shown the site will not pose unacceptable risks, therefore allowing backfill of the excavation. Approx cost = $110,000ION AND ALLOWING TREATMENT BY THE EXISTING, MODIFIED GROUND WATER EXTRACTION SYSTEM. APPROX. COST OF THIS SAMPLING WAS $50,000 WHICH WAS PAID FOR BY THE RP.atment requirements from the County of Sacramento.nto, Rail Yard PDSA. The original five well extraction system selected as the remedial alternative was modified to be a seven well extraction and treatment system after total Volatile Organic Compound (VOC) discharge levels exceeded the 100 parts pes the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was held from February 25 throughCRA Unit groundwater treatment systems. The Drum Storage Area and Ponds and Ditch Study Area RCRA Units are to be incorporated into the CERCLA Study areas (Northern Shops Study Area for Former Drum Storage Area and Lagoon Study Area of Ponds and Ditan soil, if not used for play areas. Restricted uses include 1) excavation for any purpose other than remediation 2) residential, 3) public or institutional uses 4) educational 5) day care 6) parks, playgrounds water features, open space, yards, garch), although will maintain its unique RCRA identity as subsections in future CERCLA monitoring, letters and reports.Approx. 110,000,000 gallons pumped & treated this FY. Approx. cost = $250,000 (RP funded)March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.dens and landscaped areas. Soil must be managed as approved by the Department and infrastructure improvements must be developed consistent with the Deed restriction. In the industrial or commercial use areas, where exposure to soils is possible, sucer billion (ppb) total VOC level required for extraction and discharge into the Sacramento City sewer system. An original groundwater extraction well, exw-4, was identified as the primary source of VOC's. To address this, SPTCo installed two additPublic comments were received by DTSC and addressed through a responsiveness summary.(RP funded)ional groundwater extraction wells, exw-6 and exw-7, and connected exw-4, exw-6 and exw-7 to the existing Drum Storage Area soil vapor/groundwater extraction system for treatment prior to discharge. The original PDSA groundwater extraction system wh as landscaped area or easements, the owner shall continually keep and maintain clean soil to such depth as the owner or occupant has demonstrated to the reasonable satisfaction of the Department to be protective of human health and the environmentas in operation on November 5, 1992. The complete, modified groundwater extraction system has been in operation since Aug. 15, 1994.. If additional contamination is found during development, adequate measures must be taken to achieve

Comments: DES - The DTSC approved the Final Remediation Design and Implementation Report (RDIP) on May 22, 2000, for the Northern Shops Study Area.RI/FS -- THE NORTHERN SHOPS STUDY AREA (NSSA) REPRESENTS APPROXIMATELY 35 ACRES OF THE 240-ACRE SPTCO-SACRAMENTO RAILYARD. THE APPROVED RIFS HAS INITIALLY IDENTIFIED 180,000 CUBIC YARDS OF CONTAMINATED SOILS THAT WILL REQUIRE OFFSITE DISPOSAL.DESIGN (DSVSI) and DESIGN (DSGWI)--The designs approved extraction and treatment of VOCs and TPH in soil and groundwater at the former drum storage area facility.CEQA/NOE--DTSC prepared a Notice of Exemption (NOE) for an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine, and Northern ShopFRA (DSVS1) and FRA (DSGW) -- The groundwater extraction and treatment and soil vapor extraction and treatment systems have been constructed at the former drum storage area facility. Normal operation of the systems began 09/15/1994.RAP - The DTSC approved the Final RAP, dated February 14, 2000, for the Northern Shops Study Area, which consists of 35 acres of the 240 acre SPTCo-Sacramento Rail Yard Site. The approved alternative for remediation for the 180,650 cubic yards of cAsbestos Contingiency PlanDrum Storage Area Groundwater Treatment System Construction completedRAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishORDER (DOS&M) -- An Enforceable Agreement was completed for the Operation and Maintenance of the groundwater and vapor extraction systems at the former drum storage area facility.Notice of Determinationes the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was held from February 25 throughontaminated soils identified the RAP is excavation, land farming, chemical stabilization and, off-site disposal. Implementation of the selected alternative is schedule to begin in May of 2000 and to continue through October of 2005. The preliminarys RAP for Soil. The ACP establishes the process to identify the presence of and safely clean up asbestos if found during future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/cost of the proposed alternative is estimated to be $14,353,374. CEQA/NOD - The DTSC approved the Notice of Determination for the LSA Final Amended (FARAP), and the NSSA, CSNSA, and CCSA Final Remedial Action Plan (FRAP) on February 16, 2000.March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.03. Public comments were received by DTSC and addressed through a responsiveness summary.

Comments: CEQA/NOD - The DTSC approved the Notice of Determination for the LSA Final Amended (FARAP), and the NSSA, CSNSA, and CCSA Final Remedial Action Plan (FRAP).RI/FS -- The Union Pacific Railroad Company has completed soil characterization of the former Southern Pacific Transportation Company - Sacramento Railyard Car Shop Nine Study Area (CSNSA). Groundwater contamination for the CSNSA will be addressed wDES/RDIP -- DESIGN/REMEDIAL DESIGN IMPLEMENTATION PLAN. THE CAR SHOP NINE STUDY AREA (CSNSA) IS APPROXIMATELY 44 ACRES OF THE 240 ACRE FORMER SPTCO RAIL YARD LOCATED IN DOWNTOWN SACRAMENTO. THE CSNSA WAS UTILIZED FOR CONSTRUCTING AND PAINTING RAILCEQA/NOE--DTSC prepared a Notice of Exemption (NOE) for an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine, and Northern ShopDES - The DTSC approved the Final Remediation Design and Imple- mentation Report (RDIP) on May 22, 2000, for the Car Shop Nine Study Area, 40 acres of the 240 acre SPTCo - Sacramento Rail Yard Site. The approved RDIP is for the 132,718 cubic yardsRAP - The DTSC approved the Final RAP, for the Car Shop Nine Study Area, which consists of 40 acres of the 240 acre SPTCo- Sacramento Rail Yard site. The approved alternative for approved alternative for remediation for the 132,718 cubic yards of coRAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishThe 7th Street Corridor deed restriction prohibits land uses including residental, hospital, public or private schools for persons uncer 18 years of age, day care centers, raising of food, drilling for water, and extraction of groundwater. No activities are allowed that will disturb the soil without a soils management plan and health and safety plan and contaminated soils brought to the surface shall be managed in accordance with all applicable state and federal laws. The deed restriction as RAP for Soil. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary. The ACP establof contaminated soils consists of excavation, land farming, chemical stabilization and, off-site disposal. Implementation of the RDIP is scheduled to begin in May of 2000, and to continue through October of 2005. The preliminary costs of the propoithin the Lagoon Groundwater and Central Shops South Plume RI/FS and RAP. The CSNSA was utilized for constructing rail cars, painting rail cars, sandblasting, general offices and railyard operations buildings. Additionally, five Underground StorageCARS; SANDBLASTING; GENERAL OFFICES; AND RAIL YARD OPERATIONS. THE RDIP 2004 PROVIDES FOR EXCAVATIONS, STORAGE, TREATMENT, AND OFFSITE DISPOSAL OF APPROXIMATELY 120,000 CUBIC YARDS OF SOIL CONTAMINATED VOLATILE ORGANIC COMPOUNDS (VOCs), SVOC, AND Tntaminated soils identified in the RAP is excavation, land farming, chemical stabilization and off-site disposal. Implementation of selected alternative is scheduled to being in May of 2000 and to continue through October of 2005. The preliminary ces the process to identify the presence of

California - Hazardous Waste Tracking System - Datamart

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

NOTES:

Sites may be listed in more than one database

Map ID	Site	Database(s)	EPA ID Number

39 **SP, SAC.-LOCOMOTIVE WORKS** **CA BOND EXP. PLAN** **S100833179**
401 "I" STREET **N/A**
SACRAMENTO, CA 95814

CA BOND EXP. PLAN:

Reponsible Party:	RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Denver and Rio Grande Railroad
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Denver, CO
Project Revenue Source Desc:	The Department has budgeted $100,000 for oversight activities. The RP has agreed in the enforceable agreement to pay DHS oversight costs on a quarterly basis. The responsible parties will pay all costs associated with cleanup.
Site Description:	This is an old locomotive works for the cleaning and refurbishing of coal and diesel engines and railcars. The works were established in 1865.
Hazardous Waste Desc:	Known contaminants in shallow ground water include heavy metals, petroleum hydrocarbons, inorganic solvents and organic solvents. Lead is a heavy metal of particular concern. Benzene is a likely petroleum hydrocarbon contaminant. Kerosene is a likely organic solvent contaminant. Another organic solvent likely to have contaminated the site is 1,1,1-trichloroethane.
Threat To Public Health & Env:	Potential pathways of exposure include ingestion, inhalation and dermal contact. Potential receptors include humans, mammals, birds and freshwater fish. The site is located within one half mile of the Sacramento and American Rivers. Shallow ground water flow is predominantly to the East. Wells serving Bannon Street residents have been tested for organics and metals. Results showed all wells to be uncontaminated by organics and metals.
Site Activity Status:	An enforceable agreement has been implemented between DHS and the RP. A scoping document has been submitted by the RP. A work plan and schedule for investigation and cleanup was submitted October, 1988. A number of underground tanks have already been removed and have received closure approval by the RWQCB.

California - Hazardous Waste Tracking System - Datamart

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo Corrective Action Summary:

Event:	Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.
Event Date:	01/09/2004
Event:	Igration of Contaminated Groundwater under Control, More information is needed to make a determination.
Event Date:	01/10/2001
Event:	Current Human Exposures under Control, Current human exposures are NOT under control.
Event Date:	01/10/2001
Event:	Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Comments:	DES/RDIP -- DESIGN/REMEDIAL DESIGN IMPLEMENTATION PLAN. THE LAGOON STUDY AREA (LSA) IS APPROXIMATELY 434 ACRES OF THE 240 ACRE FORMER SPTCO RAIL YARD LOCATED IN DOWNTOWN SACRAMENTO. THE LSA WAS UTILIZED FOR AS AN INDUSTRIAL WASTEWATER LAGOON, OIL/CEQA/NOD--An NOD was approved for actions selected under a Remedial Action Plan Amendment prepared for soil remediation of an 11 acre Northwestern portion of the Lagoon Study Area. DTSC prepared an Initial Study Agency Checklist which relies on theCEQA - The DTSC issued the Notice of Determination for the Lagoon Study Area Final RAP, approved remedial alternative on December 30, 1999.CEQA/NOD - The DTSC approved the Notice of Determination for the LSA Final Amended (FARAP) for Soil, and the NSSA, CSNSA, and CCSA Final Remedial Action Plan (FRAP) for Soil.Implementation Plan ApprovedAsbestos Contingency PlanThe 7th Street Corridor deed restriction prohibits land uses including residental, hospital, public or private schools for persons uncer 18 years of age, day care centers, raising of food, drilling for water, and extraction of groundwater. No activFinal Amended RAP approved for soilRAP -- DTSC APPROVED THE FINAL RAP, DATED 12/28/98, APPROVED 12/30/98, FOR THE LSA 51 ACRES OF THE 240-ACRE SPTCO-SACRAMENTO RAILYARD SITE. THE APPROVED ALTERNATIVE FOR REMEDIATION FOR THE 239,640 CUBIC YARDS OF CONTAMINATED SOILS IDENTIFIED IN THERIFS -- Soil FS approved. LSA represents 51 acres of the 240 acre SPTCo-Sacramento Rail Yard. The approved RIFS has initially identified 51,965 cubic yards of contaminated soils that will require offsite disposal and 187,675 cubic yards of contamRA (LSARA) -- The Interim Remedial Measure (IRM) is being implemented for remediation of soil contaminated with Volatile Organic Compounds (VOC's), Semi-Volatile Organic Compounds (SVOC's), and metals from operation and maintenance activities at thCEQA/NOE--DTSC prepared a Notice of Exemption (NOE) for an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine, and

Map ID	Site	Database(s)	EPA ID Number

UP, DOWNTOWN SAC - LAGOON (Continued) **S105954434**

Northern ShopRAP/NWLSA--DTSC approved a RAP amendment for soil cleanup of an 11 acre portion of the Lagoon Study Area (LSA) of the railyard site. The Amendment to the 2000 Final Amended Industrial Wastewater Lagoon Remedial Action Plan for Soil changes the remeDES - The DTSC approved the Final Remediation Design and Implementation Report (RDIP) for Soil on May 22, 2000, for the Lagoon Study Area, 51 acres of the 240 acre SPTCo - Sacramento Rail Yard Site. The approved RDIP for remediation for the 239,640RAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishes the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was held from February 25 throughities are allowed that will disturb the soil without a soils management plan and health and safety plan and contaminated soils brought to the surface shall be managed in accordance with all applicable state and federal laws. The deed restriction acubic yards of contaminated soils consists of excavation, ex-situ vapor extraction, chemical stabilization and, off-site disposal. Imple-mentation of the RDIP is scheduled to begin in May of 2000, and to continue through October of 2005. The prelimCity of Sacramento EIRs prepared for redevelopment projects which includes the Railyard. The NOD and supporting evaluations were made available for public review for 30 days from 2/25/03 to 3/27/03 and was presented at the 3/11/03 public meeting hes RAP for Soil. The ACP establishes the process to identify the presence of and safely clean up asbestos if found during future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/e SPTCo-Sacramento Rail Yard. The IRM consists of excavation remediation of approximately 2500 cubic yards of contaminated soils from the Industrial Waste Water Lagoon. The contaminated soil will be stockpiled and treated at the Drum Storage Areainated soils that will be disposed of onsite. The onsite disposal alternative includes design and construction of an onsite 450,000 cubic yard solid waste landfill, primarily designed for relatively intert metals contaminated soils. The landfill wRAP IS EXCAVATION, EX-SITU VAPOR EXTRACTION, CHEMICAL STABILIZATION, ONSITE SECURE CONTAINMENT AND OFFSITE DISPOSAL. THE ONSITE DISPOSAL ALTERNATIVE INCLUDES DESIGN AND CONSTRUCTION OF AN ONSITE, 450,000 CUBIC YARD SOLD WASTE LANDFILL, PRIMARILY DESWATER SEPERATOR OVERFLOW AREA, AND FORMER LOCATION OF A 50,000 GALLON OIL STORAGE TANK. THE RDIP 2004 PROVIDES FOR EXCAVATIONS, STORAGE, TREATMENT, AND OFFSITE DISPOSAL OF APPROXIMATELY 120,000 CUBIC YARDS OF SOIL CONTAMINATED VOLATILE ORGANIC COMPOdy for the northwestern corner of the LSA from excavation and offsite disposal to grading and capping with an engineered paved cover. Land use will be limited under a deed restriction. In compliance with CEQA, DTSC has prepared a Notice of DeterminIGNED FOR RELATIVELY INERT METALS CONTAMINATED SOILS. THE LANDFILL WILL BE DESIGNED AND CONSTRUCTED AS A CLASS II LANDFILL. THE ONSITE LANDFILL HAS BEEN APPROVED WITH THE FOLLOWING REQUIREMENTS: NO LIQUIDS MAY BE DISPOSED ONSITE, ALL METAL CONTAMINAMarch 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.ld at the Sacramento Amtrak Depot. A notice was displayed in the Sacramento Bee newspaper and a fact sheet was mailed to the site

UP, DOWNTOWN SAC - LAGOON (Continued) **S105954434**

mailing list to provide information and announce the review period and a public meeting.03. Public comments were received by DTSC and addressed through a responsiveness summary.ill be designed and constucted as a Class II landfill. The onsite landfill has been approved with the following requirements: no liquids may be disposed of onsite, all metal contaminated soils with organics may only be placed in the landfill if thinary costs of the remediation is estimated to be $17,115,480.UNDS SVOCs, AND TOTAL PETROLEUM HYDROCARBON (TPH) IN THE LAGOON STUDY AREA, AND CENTRAL CORRIDOR STUDY AREA, AND CAR SHOP NINE STUDY AREA FOR WHICH REMEDIAL ACTION PLANS (RAPs) HAVE BEEN PREVIOUSLY APPROVED.lso allows access for the Department for monitoring, inspection, and other activities.(DSA utilizing the existing DSA soil vapor extraction and treatme system to remediate VOC contamination. The VOC remediated soils will then be chemically stabilized/solidified to treat SVOC and metal contamination. The remediated/stabilized soil wation (NOD) for this project. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.ill then be disposed of at the ECDC Utah Landfill.TED SOILS WITH ORGANICS MAY ONLY BE PLACED IN THE LANDFILL IF THE ORGANIC CONSTITUENTS ARE ALL LESS THAN THRESHOLD VALUES, NO RCRA WASTES, AND NO CALIFORNIA HAZARDOUS WASTE THAT HAS NOT BEEN CLASSIFIED AS DESIGNATED WASTE. IMPLEMENTATION OF THE SELe organic constituents are all less than threshold values, no RCRA waste, and no California Hazardous Waste that has not been classified as designated waste. The preliminary cost of the proposed alternative, Alternative H, is $20,315,000. The final RAP is scheduled for completion in September 1998.ECTED ALTERNATIVE IS SCHEDULED TO BEGIN IN APRIL OF 2000 AND TO CONTINU THROUGH OCTOBER OF 2005. THE PRELIMINARY COST OF THE PROPOSED ALTERNATIVE IS EXTIMATED TO BE $20,315,000.

future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/e SPTCo-Sacramento Rail Yard. The IRM consists of excavation remediation of approximately 2500 cubic yards of contaminated soils from the Industrial Waste Water Lagoon. The contaminated soil will be stockpiled and treated at the Drum Storage Areainated soils that will be disposed of onsite. The onsite disposal alternative includes design and construction of an onsite 450,000 cubic yard solid waste landfill, primarily designed for relatively intert metals contaminated soils. The landfill wRAP IS EXCAVATION, EX-SITU VAPOR EXTRACTION, CHEMICAL STABILIZATION, ONSITE SECURE CONTAINMENT AND OFFSITE DISPOSAL. THE ONSITE DISPOSAL ALTERNATIVE INCLUDES DESIGN AND CONSTRUCTION OF AN ONSITE, 450,000 CUBIC YARD SOLD WASTE LANDFILL, PRIMARILY DESWATER SEPERATOR OVERFLOW AREA, AND FORMER LOCATION OF A 50,000 GALLON OIL STORAGE TANK. THE RDIP 2004 PROVIDES FOR EXCAVATIONS, STORAGE, TREATMENT, AND OFFSITE DISPOSAL OF APPROXIMATELY 120,000 CUBIC YARDS OF SOIL CONTAMINATED VOLATILE ORGANIC COMPOdy for the northwestern corner of the LSA from excavation and offsite disposal to grading and capping with an engineered paved cover. Land use will be limited under a deed restriction. In compliance with CEQA, DTSC has prepared a Notice of DeterminIGNED FOR RELATIVELY INERT METALS CONTAMINATED SOILS. THE LANDFILL WILL BE DESIGNED AND CONSTRUCTED AS A CLASS II LANDFILL. THE ONSITE LANDFILL HAS BEEN APPROVED WITH THE FOLLOWING REQUIREMENTS: NO LIQUIDS MAY BE DISPOSED ONSITE, ALL METAL CONTAMINAMarch 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.ld at the Sacramento Amtrak Depot. A notice was displayed in the Sacramento Bee newspaper and a fact sheet was mailed to the site mailing list to provide information and announce the review period and a public meeting.03. Public comments were received by DTSC and addressed through a responsiveness summary.ill be designed and constucted as a Class II landfill. The onsite landfill has been approved with the following requirements: no liquids may be disposed of onsite, all metal contaminated soils with organics may only be placed in the landfill if thinary costs of the remediation is estimated to be $17,115,480.UNDS SVOCs, AND TOTAL PETROLEUM HYDROCARBON (TPH) IN THE LAGOON STUDY AREA, AND CENTRAL CORRIDOR STUDY AREA, AND CAR SHOP NINE STUDY AREA FOR WHICH REMEDIAL ACTION PLANS (RAPs) HAVE BEEN PREVIOUSLY APPROVED.lso allows access for the Department for monitoring, inspection, and other activities.(DSA utilizing the existing DSA soil vapor extraction and treatme system to remediate VOC contamination. The VOC remediated soils will then be chemically stabilized/solidified to treat SVOC and metal contamination. The remediated/stabilized soil wation (NOD) for this project. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.ill then be disposed of at the ECDC Utah Landfill.TED SOILS WITH ORGANICS MAY ONLY BE PLACED IN THE LANDFILL IF THE ORGANIC CONSTITUENTS ARE ALL LESS THAN THRESHOLD VALUES, NO RCRA WASTES, AND NO CALIFORNIA HAZARDOUS WASTE THAT HAS NOT BEEN CLASSIFIED AS DESIGNATED WASTE. IMPLEMENTATION OF THE SELe organic constituents are all less than threshold values, no RCRA waste, and no California Hazardous Waste that has not been classified as designated waste. The preliminary cost of the proposed alternative, Alternative H, is $20,315,000. The final RAP is scheduled for

39 **SP, SAC. - BATTERY SHOP** **CA BOND EXP. PLAN** **S100833177**
401 "I" STREET **N/A**
SACRAMENTO, CA 95814

CA BOND EXP. PLAN:

Reponsible Party:	RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Denver and Rio Grande Railroad/Southern Pacific Transportation Co.
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Denver/San Francisco, CO/CA
Project Revenue Source Desc:	The Department has budgeted $50,000 for oversight of the responsible parties cleanup activities. The RP has agreed to pay DHS oversight costs in the enforceable agreement on a quarterly basis. The responsible parties will pay all costs associated with cleanup.
Site Description:	The site encompasses three RCRA sites under one Court Order. The Court Order time schedule was included in an Enforceable Agreement dated June 2, 1988. These entail (a) a battery storage and disposal area (including dry well disposal), (b) a 2000 square foot drum storage area (containing solvents) and (c) a grit blast waste pile area (containing over 3100 cubic yards of sand).
Hazardous Waste Desc:	Contaminants include (a) copper, lead and petroleum hydrocarbons at the grit blast area, (b) lead and acids at the battery storage and disposal area, and (c) lead and organic compounds at the drum storage area.
Threat To Public Health & Env:	Potential pathways of exposure include ingestion, inhalation and dermal contact at all three locations. Potential receptors include humans, mammals, birds and freshwater fish. The site is within one half mile of the Sacramento and American Rivers, and seasonal fluctuation of shallow ground water direction has been confirmed.
Site Activity Status:	A third round of soil and ground water sampling was completed in September, 1988. Results from these investigations will be used to modify the analysis of remedial alternatives presented in March, 1988. A Court Order was signed July 30, 1987. The Order set a time schedule for a combined RAP/RCRA Closure. The time schedule in the Court Order was included in an enforceable agreement with DHS dated June 2, 1988. As an interim remedial measure it is proposed to centralize contaminated soils from the Battery Shop, Drum Storage and Sand Pile sites. Stockpiled wastes will be tarped. Drainage will also be collected down slope. Wastes will be stockpiled above visqueen to prevent percolation.

39 **SP, SAC. - PONDS & DITCH** **CA BOND EXP. PLAN** **S100833178**
401 "I" STREET **N/A**
SACRAMENTO, CA 95814

CA BOND EXP. PLAN:

Reponsible Party:	RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Southern Pacific Transportation Company/Denver and Rio Grande Railroad
Project Revenue Source Addr:	Southern Pacific Building, 1 Market Plaza
Project Revenue Source City,St,Zip:	San Francisco/Denver, CA/CO 94105
Project Revenue Source Desc:	DHS has budgeted $50,000 for oversight activities. The RP has agreed to pay DHS oversight costs in the enforceable agreement on a quarterly basis. The responsible parties will pay all costs associated with cleanup.
Site Description:	Industrial waste water disposal ponds and an industrial waste water conveyance ditch are the focal points of this site investigation. A RAP/RCRA closure is required.
Hazardous Waste Desc:	Sludge and soil samples analyzed contained high concentrations of copper, lead, zinc, 1,1,1-trichloroethane, trichloroethane, tetrachloroethene, naphthalene, and bis (2-ethylhexyl) phthalate. Ground water contaminants include chromium, methylene chloride, 1,1-dichloroethane (ethylene chloride), and trans-acetylene dichloride (trans-1,2-dichloroethane).
Threat To Public Health & Env:	Potential pathways of exposure include ingestion, inhalation and dermal contact. Potential receptors include humans, mammals, birds, insects, freshwater fish, nematodes, soil bacteria and grasses common to the Central Valley. The City of Sacramento has a domestic water intake from the Sacramento River located approximately one mile north of the site. Ground water is used by the State Printing Plant and Crystal Dairy for industrial purposes just north of the site. Wells serving Bannon Street residents have been tested for organics, metals and coliform organisms. Results showed all wells uncontaminated by organics and metals.
Site Activity Status:	Sludge from both the ponds and ditch was excavated and disposed of at a Class I landfill in 1984 and 1985 as IRMs. Three rounds of remedial investigation have been completed at the ponds and ditch, the most recent in May, 1987. Bench scale testing of soil solidification and soil washing is now underway. Until a final design is approved, the extraction well near the ponds and ditch has been turned off. A final feasibility study (FS) was received in October, 1988.

Comments:	DTSC prepared a notice of determination (NOD) for Removal Action Workplan (RAW) for soil cleanup in six acres of the Central Shops Study Area of the Rail Yard. This plan would result in soil cleanup along a proposed new rail line corridor prior to mSite Screening is completed.Final.RP submitted inserts to the Draft HRA Report to update the conclusions to address DTSC’s request for an indoor air evaluation. Conclusions were updated to indicate although no unacceptable risks are associated with the Central Shops and South PlumeDTSC approved the "Completion of Soil Remediation in 4.25 acre Main Freight Line Relocation within the Central Shops Area" on July 1, 2005. The RWQCB provided concurrence on July 8, 2005.Offsite Groundwater RA CompletedDTSC approved RAW for soil cleanup of six acres of the Central Shops Study area along a new rail line corridor prior to moving the frieght track. The RAW proposes excavation of soil impacted with SVOCs, VOCs and metals and implementation will be conPreliminary Assessment: Central Valley RWQCB (12/17/81) - operations are locomotive maintenance, engine building/ rebuilding, forging, metal painting, battery machining, wheel brake, & fabrication. In operation since 1863. 100-year flood plain.Asbestos Contingency PlanNotice of DeterminationCalifornia Environmental Quality Act (CEQA) Ground Water Removal Action (GWRA) -- The DTSC has approved the final California CEQA package for vertical and horizontal containment of an off-site groundwater plume emanating from the SPTCo-Sacramento RaEnforceable Agreement dated June 2, 1988ground water under current conditions and land use, potential unacceptable risks may be associated with future land use, thus further evaluation with repect to soil and groundwater is required.

UP, DOWNTOWN SAC - CENTRAL SHOPS (Continued) **S105954432**

This additional evaluation will be included in the Feassistent with RDIP approved for soil remediation activities.il Yard off-site to the south, the South Plume. The CEQA package project is implementation of two Interim Remedial Measures (IRMs), the South Plume Source Control and the South Plume Margin Control. The South Plume Margin Control consists of a groving the freight track. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comment were received by DTSC and addressed through a responsiveness summary.ibility Study as part of the development of remedial goals for soil and groundwater. The future evaluation of VOCs will include all applicable exposure pathways including indoor air.oundwater extraction system located on P Street in Sacramento for leading edge capture. The South Plume Source Control consists of a groundwater/soil vapor extraction and treatment system located within the SPTCo-Sacramento Rail Yard to capture identified sources. Removal Action Work Plan (RAW) Groundwater Removal Action (GWRA) -- A Removal Action Workplan was approved for two South Plume Margin Control. The South Plume Margin Control consists of a groundwater extraction system located onP Street in Sacramento. The South Plume Source Control is comprised of a groundwater/soil vapor extraction and treatment system located within the Central Shops Study area of the SPTCo-Sacramento Rail Yard. The Interim Remedial Measures (IRMs) arebeing implemented to control the lateral and veritcal migration of groundwater contaminated with volatile organic compounds. The groundwater extraction system became operational on May 12, 2001.

the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was held from February 25 throughCRA Unit groundwater treatment systems. The Drum Storage Area and Ponds and Ditch Study Area RCRA Units are to be incorporated into the CERCLA Study areas (Northern Shops Study Area for Former Drum Storage Area and Lagoon Study Area of Ponds and Ditan soil, if not used for play areas. Restricted uses include 1) excavation for any purpose other than remediation 2) residential, 3) public or institutional uses 4) educational 5) day care 6) parks, playgrounds water features, open space, yards, garch), although will maintain its unique RCRA identity as subsections in future CERCLA monitoring, letters and reports.Approx. 110,000,000 gallons pumped & treated this FY. Approx. cost = $250,000 (RP funded)March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.dens and landscaped areas. Soil must be managed as approved by the Department and infrastructure improvements must be developed consistent with the Deed restriction. In the industrial or commercial use areas, where exposure to soils is possible, sucer billion (ppb) total VOC level required for extraction and discharge into the Sacramento City sewer system. An original groundwater extraction well, exw-4, was identified as the primary source of VOC's. To address this, SPTCo installed two additPublic comments were received by DTSC and addressed through a responsiveness summary.(RP funded)ional groundwater extraction wells, exw-6 and exw-7, and connected exw-4, exw-6 and exw-7 to the existing Drum Storage Area soil vapor/groundwater extraction system for treatment prior to discharge. The original PDSA groundwater extraction system wh as landscaped area or easements, the owner shall continually keep and maintain clean soil to such depth as the owner or occupant has demonstrated to the reasonable satisfaction of the Department to be protective of human health and the environmentas in operation on November 5, 1992. The complete, modified groundwater extraction system has been in operation since Aug. 15, 1994.. If additional contamination is found during development, adequate measures must be taken to achieve permanent remediation and prevent unacceptable exposure to humans or the environment. The soil disposal shall be managed in accordance with all applicable state and federal laws. No water from below the surface shall be extracted or utilized in any way or consumed, although access will be allowed for groundwater monitoring and extraction systems for Union Pacific, it successors or agents, andthe Department for monitoring, inspection, and other activities.

Shop Nine, and Northern ShopDES - The DTSC approved the Final Remediation Design and Imple- mentation Report (RDIP) on May 22, 2000, for the Car Shop Nine Study Area, 40 acres of the 240 acre SPTCo - Sacramento Rail Yard Site. The approved RDIP is for the 132,718 cubic yardsRAP - The DTSC approved the Final RAP, for the Car Shop Nine Study Area, which consists of 40 acres of the 240 acre SPTCo- Sacramento Rail Yard site. The approved alternative for approved alternative for remediation for the 132,718 cubic yards of coRAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishThe 7th Street Corridor deed restriction prohibits land uses including residental, hospital, public or private schools for persons uncer 18 years of age, day care centers, raising of food, drilling for water, and extraction of groundwater. No activities are allowed that will disturb the soil without a soils management plan and health and safety plan and contaminated soils brought to the surface shall be managed in accordance with all applicable state and federal laws. The deed restriction as RAP for Soil. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary. The ACP establof contaminated soils consists of excavation, land farming, chemical stabilization and, off-site disposal. Implementation of the RDIP is scheduled to begin in May of 2000, and to continue through October of 2005. The preliminary costs of the propoithin the Lagoon Groundwater and Central Shops South Plume RI/FS and RAP. The CSNSA was utilized for constructing rail cars, painting rail cars, sandblasting, general offices and railyard operations buildings. Additionally, five Underground StorageCARS; SANDBLASTING; GENERAL OFFICES; AND RAIL YARD OPERATIONS. THE RDIP 2004 PROVIDES FOR EXCAVATIONS, STORAGE, TREATMENT, AND OFFSITE DISPOSAL OF APPROXIMATELY 120,000 CUBIC YARDS OF SOIL CONTAMINATED VOLATILE ORGANIC COMPOUNDS (VOCs), SVOC, AND Tntaminated soils identified in the RAP is excavation, land farming, chemical stabilization and off-site disposal. Implementation of selected alternative is scheduled to being in May of 2000 and to continue through October of 2005. The preliminary ces the process to identify the presence of and safety clean up of asbestos if found during future soil excavation.ost of the proposed alternative is estimated to be $8,050,957. CEQA/NOD -sed alternative is estimated to be 8,050,957.Tanks were located at the CSNSA. During Phase I characterization, soil gas samples were collected from 11 locations, 31 soil borings were drilled and sampled, andgroundwater samples were collected from 24 locations. During Phase II, the final PhaseOTAL PETROLEUM HYDROCARBON (TPH) IN THE CAR SHOP NINE STUDY AREA, LAGOON STUDY AREA, AND CENTRAL CORRIDOR STUDY AREA FOR WHICH REMEDIAL ACTION PLANS (RAPs) HAVE BEEN PREVIOUSLY APPROVED.lso allows access for the Department for monitoring, inspection, and other activities.ishes the process to identify the presence of and safely clean up asbestos if found during future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/03. Public comments were recei25 additional soil borings were drilled. Compounds of concern (COC'S) detected in the soil included VOC'S-VC and TCE, SVOC'S-PNA'S, Anthracene and Chrysene, TPH-#2 and #6 fuel oil, oil and grease and extractable and
